MACKENZIE VALLEY PIPELINE INQUIRY

IN THE MATTER OF APPLICATIONS BY EACH OF

(a) CANADIAN ARCTIC GAS PIPELINE LIMITED FOR A  
RIGHT-OF-WAY THAT MIGHT BE GRANTED ACROSS  
CROWN LANDS WITHIN THE YUKON TERRITORY AND  
THE NORTHWEST TERRITORIES, and

(b) FOOTHILLS PIPE LINES LTD. FOR A RIGHT-OF-WAY  
THAT MIGHT BE GRANTED ACROSS CROWN LANDS  
WITHIN THE NORTHWEST TERRITORIES,

FOR THE PURPOSE OF A PROPOSED MACKENZIE VALLEY PIPELINE

and

IN THE MATTER OF THE SOCIAL, ENVIRONMENTAL AND  
ECONOMIC IMPACT REGIONALLY OF THE CONSTRUCTION,  
OPERATION AND SUBSEQUENT ABANDONMENT OF THE ABOVE  
PROPOSED PIPELINE

(Before the Honourable Mr. Justice Berger, Commissioner)

Yellowknife, N.W.T.

November 17, 1975.

APPEARANCES:

Mr. Ian G. Scott, Q.C.,  
Mr. Stephen T. Goudge,  
Mr. Alick Ryder and  
Mr. Ian Roland for Mackenzie Valley Pipeline  
Limited;

Mr. Pierre Genest, Q.C.,  
Mr. Jack Marshall, and  
Mr. Darryl Carter for Canadian Arctic Gas  
Pipeline Limited;  
Mr. Reginald Gibbs, Q.C.,  
Mr. Alan Hollingworth &  
Mr. John W. Lutes, for Foothills Pipe Lines Ltd.;

Mr. Russell Anthony &  
Pro. Alastair Lucas for Canadian Arctic Resources  
Committee;

Mr. Glen W. Bell and  
Mr. Geery Sutton, for Northwest Territories  
Indian Brotherhood, and  
Metis Association of the  
Northwest Territories;

Mr. John Bayly  
of  
Miss Leslie Lane for Inuit Tapirisat of Canada,  
and The Committee for  
Original Peoples Entitle-  
ment;

Mr. Ron Veale and  
Mr. Allen Lueck for The Council for the Yukon  
Indians;

Mr. Carson H. Templeton, for Environment Protection  
Board;

Mr. David Reesor for Northwest Territories  
Association of Municipal-  
ities;

Mr. Murray Sigler for Northwest Territories  
Chamber of Commerce.

3 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

4 MR. GIBBS: Mr. Commissioner,  
5 we have had some problems securing accommodation for  
6 this entire panel and we're hopeful that we will be  
7 able to let them go in time for them to catch the  
8 7:50 aircraft tonight. I have spoken to my friend,  
9 Mr. Goudge, he says there will be no problem. In the  
10 event that there is, the one person who must get away  
11 for personal reasons is Mr. Lawrence, and we'd like  
12 to excuse him if the panel isn't completed on time.

13 Secondly, sir, I have brought  
14 up with me some 35 responses to requests made of  
15 previous panels, and we'd be prepared to file those  
16 when this panel is completed or at the start of the  
17 evening session, whichever happens first and whichever  
18 is most convenient.

19 THE COMMISSIONER: Thank you,  
20 Mr. Gibbs. Mr. Ryder?

21 MR. RYDER: Yes, thank you, Mr.  
22 Commissioner.

23 MR. MARSHALL: Excuse me, sir,  
24 before my friend begins questioning, I have the next  
25 panel for Arctic Gas available and they had asked me  
26 whether or not it was intended that we sit tonight?

27 THE COMMISSIONER: Yes, I intend  
28 to sit tonight and I think that we will begin with  
29 your panel as soon as Mr Ryder's cross-examination of  
30 this panel is completed.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
~~Cross-Exam by Ryder~~  
MR. MARSHALL: Fine, sir.

THE COMMISSIONER: Will that  
be all right?

MR. MARSHALL: Yes, they'll  
be ready.

L.W. BOUCKHOUT  
C.W. DREW  
FREDERIC B. CLARIDGE  
D.M. DAVISON  
HERMAN VAARTNOU  
NORMAN A. LAWRENCE  
JAMES R. TAYLOR  
BRIAN O.K. REEVES, resumed:

CROSS-EXAMINATION BY MR. RYDER:

Q Mr. Bouckhout, I wonder  
if I can begin by putting to you some general proposi-  
tions for environmental concerns, and these, I might  
say to you, are the same general propositions that were  
put to Mr. Hemstock of the Arctic Gas Phase 2 panel,  
and the purpose of doing so was to see if there is any  
difference in the approach which you take on a general  
basis to the general weight of these matters compared  
to the Arctic Gas approach. Now, the first proposition  
is that the land or landscape should not be unnecessarily  
disturbed and I put to you this is a proposition that  
applies everywhere, not just in areas of high sensi-  
tivity.

WITNESS BOUCKHOUT: I would  
generally agree with that.

Q The next is that visual  
and aesthetic values should be protected and visual  
impacts minimized.

A Where possible, I agree.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

Q And that third, then,  
that present wilderness areas should be protected and  
disturbance of such areas minimized.

A I agree.

Q Fourthly, the disturbance  
of the ground surface, together with the organic mat  
and vegetation that protects it should be minimized as  
a means of reducing or avoiding a wide range of  
environmental impacts and engineering problems.

A Agreed.

Q And that fifthly, I'm  
dealing here with the problem caused by the fact that  
your project will enter into competition with -- for  
resources which may be in limited supply, and when that  
competition is engaged, the result then would be that  
there would be a demand on resources that are in short  
supply, and I'm asking you if you accept the proposi-  
tion that they should be used wisely and prudently  
and that conflict should be avoided between the use  
of such resources for any one project and other present  
or future uses of the same resources, and by setting  
these different competitions which apply to resources  
in short supply or in limited supply that a set of  
priorities would be established.

A Yes, agreed, that would  
have to be worked out, obviously, amongst the people  
or groups either directly involved or implicated in  
these, but that's certainly agreeable, yes.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross- Exam by Ryder

Q All right, and that finally, sixthly, that any overlap of the project lands, on lands which will be useful to man for other purposes, purposes of a traditional nature in the future and in the past, should be minimized and conflicts in land use should be avoided, if possible.

A Where possible that's right, yes.

Q And finally the archaeological and historical sites should be projected from disturbance by the project, and that archaeological materials that cannot be protected, some means should be adopted to salvage those.

A Agreed.

Q And then lastly, that where disturbance has taken place and as a guard against future disturbance, that some stabilization and restoration or rehabilitation measures should be implemented.

A Agreed.

Q So that the goals of Foothills, with respect to environmental protection, are in general terms the same as those of Arctic Gas.

A I would think so, if Arctic Gas has agreed to all those suppositions.

Q Now, I want to now turn to the measures you propose to approach and achieve these goals. First of all, I want you just to single out any areas of difference between your approach and

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

that of Arctic Gas. First of all with respect to the  
identification of environmental concerns.

Bouckhout, Drew, Claridge  
Davison, Vaartnou ,  
Lawrence, Taylor, Reeves  
Cross-Exam by Ryder

1  
2  
3 A I would think, sir, that  
4 as far as the identification of concerns, I can't  
5 really speak for Arctic Gas because I am not totally  
6 familiar with their identification.

7 I would think that we  
8 would be generally since they're professionals working  
9 for both competing applicants. The identification  
10 of concerns should be generally similar.

11 Q All right. If during the  
12 course of these proceedings of Phase Two and living  
13 environment in Phase Three, a difference in the concerns  
14 that you have identified is revealed, you let us  
15 know about that so that we can address the differences.

16 A Certainly.

17 Q Now, are you familiar  
18 at all with the manner that Arctic Gas rates  
19 environmental concerns and measures them so that  
20 it can proceed with the trading-off processes between one  
21 concern with another when that becomes necessary.

22 A In terms of the way  
23 they rate environmental concerns. Is that the question?

24 Q Yes.

25 A No, I am not familiar  
26 with the way they rate environmental concerns for  
27 trade-off purposes.

28 Q Well, perhaps you and  
29 your counsel can reveal if you detect any difference  
30 in the process of rating environmental concerns  
between yourself and Arctic Gas, you can let us know

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

about that so that we can address that matter as well.

MR. GIBBS: Well sir, we  
are in some difficulty in knowing what he means  
by grading environmental concerns where you use a  
numbering system and number something at one and  
something at ten or what process he is referring to.

THE COMMISSIONER: I was  
going to ask the same question.

MR. RYDER: Q Now, I have  
just assumed through this phase and Phase Three that  
it will be apparent that the burden of our questions  
in any event and I believe the burden of some other  
participants here will be to obtain disclosure of the  
kind of considerations which the environmentalists of  
both projects consider in trading-off when the trade-  
off is necessary but when the environmentalist in  
another environmental area and if there is any  
difference in the approach that you detect between  
your own approach and that of Arctic Gas, we would  
be obliged to know what that is so that we can adjust  
particular attention to that.

What we are interested  
in before Mr. Gibbs interrupts--what we are interested  
in is distinguishing the differences between your  
application and that of Arctic Gas.

MR. GIBBS: It is very, very  
difficult to have to impose upon this witness. He  
may not even know what has gone into the decision  
making process of Arctic Gas.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 If referred to harming a bird species over harming a  
3 fish species. It is putting a burden on this witness  
4 that I think he ought not to be asked to bear. He  
5 can say this is how we have gone about it. These are  
6 the factors that we took into account and this is the  
7 decision we received or we made and Arctic Gas can  
8 do the same but neither one, I think can build into  
9 it. Those things haven't advanced far enough  
10 to tell my friend what the difference is and why it  
11 happened that way.

12 THE COMMISSIONER: Well, are  
13 you able to enable to enlighten us at all, Mr. Bouckhout?

14 WITNESS BOUCKHOUT: A Well,  
15 Mr. Commissioner, I think I find the question very  
16 difficult. That type of questioning since obviously  
17 Arctic Gas have resolved their concerns and their  
18 approach to environment their way and I certainly  
19 haven't party to any of their resolutions as such nor  
20 they to ours.

21 It's very difficult to  
22 materialize these types of things to say, you know,  
23 you get a rating scale of one to ten and if, in fact,  
24 we did do that, then it would be possible for us to  
25 compare them but we cannot always use that type of  
26 a rating scale. We rely on the judgment of the  
27 various consultants, various experts we have in the  
28 field to give us an opinion as to what potential  
29 repercussions are -- if this or if that and it is very  
30 difficult to compare them on a one to one basis.

THE COMMISSIONER: Well, we

MR. RYDER: No, Mr.

A That, you know, as you  
cult to answer. This is one of  
t testimony where I simply  
it, or how my department  
that, we pretty much have to  
ng listened to Arctic Gas's  
ony and our panels and our  
draw your conclusions from that.

THE COMMISSIONER: Well, at any rate, the principles relating to preservation of

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1 environmental value is that you would find it  
2 the same as the principles that have been established  
3 by Arctic Gas but you are not aware of any differences  
4 in the application of those principles.  
5 Is that -- ?  
6

7 A None that at this  
8 stage you could really put your finger on per se that  
9 you know, I could give to the Commission right now. I  
10 think the principles definitely would have to be about  
11 the same. You know, we're a bunch of professionals  
12 working on both sides of the street and both approaching  
13 it, I think, the same way.

14 THE COMMISSIONER: Working  
15 both sides of the street. I thought it was only Mr.  
16 Lawrence who worked on both sides of the street.

17 A There are certainly some  
18 differences obviously in the routing or routes there  
19 is an obvious difference but beyond that I'd simply  
20 have to leave it at that.

Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2  
3 Q For the moment then, can  
4 I turn to another subject which is the Environmental  
5 Education Program which you propose. Now, I take it  
6 that this education program must be directed to two  
7 levels of employees. And the first level would be those  
8 who have a responsibility to introduce and apply the  
9 mitigation techniques in the field. Am I correct in  
10 that?

11 A That's one of the levels.  
12 That's right.

13 Q And that the second level  
14 would be the work crews themselves who are to be  
15 employed .onthe pipeline?

16 A That's right. The  
17 engineering people involved in designing and so on and  
18 the contractors.

19 Q Now, in your evidence in  
20 chief you refer I think to a manual for the education  
21 of your engineers?

22 A I refer to manual of  
23 environmental protection measures. This manual would  
24 be something which is put together dictating the types  
25 of protection measures which will be applied in certain  
26 circumstances in certain areas. This was not a-- My  
27 direct testimony at least did not refer directly to a  
28 manual which be used as an education tool. However,  
29 I prefer to call it an information program rather than  
30 an education program but something similar <sup>definitely</sup> will have to

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence.  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2  
3 be done.

4 Q All right. Now, the manual  
5 that you referred to, I take it, is a manual for the  
6 use of your engineers in the field?

7 A It would be primarily a  
8 manual for the use of our environmental inspectors in  
9 the field..

10 Q Now, do you propose any  
11 manual then or any means of educating the engineers in  
12 the field who are responsible for applying these  
13 mitigation procedures?

14 A Yes, certainly this will  
15 have to be done. We are not yet at the stage where we  
16 have firmly developed an information program as such,  
17 but definitely this is going to have to be done over  
18 some period of time.

19 Q So, you haven't-- Have you  
20 thought about a table of contents or have you thought  
21 about the content of a manual of this kind?

22 A Well, it will probably have  
23 to be broken down at least initially, I would think, on  
24 an aerial base. That is not a site specific, per se,  
25 but an area specific base. For instance, it would deal  
26 with spread one, spread two and so on. It would also  
27 deal with intro-structure within these spreads and the  
28 different concerns applied to the different types of  
29 spreads.

30 Q So, he would know what

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence.  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2  
3 techniques to look for in particular areas?

4 A He would know what techniques  
5 are definitely going to be applied and also what  
6 techniques over and above those can be used on a  
7 discretionary basis.

8 Q Now, the manual that you  
9 have started work on, I take, is for your inspectors?

10 A Well, as I said, we haven't  
11 actually worked on the manual. I said the manual would  
12 be prepared and that is definitely true but it would  
13 be for the inspectors to use as a guide book for their  
14 operation in the field and beyond that there is the  
15 information program in which something over and above  
16 would be developed for the information or education of  
17 both the inspectors and the construction and engineering  
18 personnel.

19 Q And I take it that that  
20 manual hasn't been started?

21 A That's right. I might say  
22 that we have had some discussion with various people  
23 along this line and we are very concerned and wish to  
24 get together with the various government agencies in  
25 terms of preparing such a manual and developing such  
26 a program.

27 Q You have then prototypes  
28 to work from?

29 A There is a prototype which  
30 was developed for the Mackenzie highway work, I believe.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2  
3 This is something that could be used as somewhat of a  
4 prototype. However, in a construction project of this  
5 scale, dealing with the types of concerns we are dealing  
6 with and winter construction and so on, it is going to  
7 have to be really started from scratch and worked up  
8 from there.

9 Q Has Alyeska got a manual  
10 of that kind?

11 A They have a manual of  
12 stipulations, environmental stipulations, yes.

13 Q That's just the terms and  
14 conditions which apply to the Alyeska line.

15 A That's right.

16 Q Do you have a manual which  
17 educates and assists the environmental inspectors in  
18 Alyeska to perform their job?

19 A Yes, I believe they do have  
20 a manual something like that. I am not personally  
21 familiar with it, but I believe they do.

22 Q Do you propose looking at  
23 that?

24 A Yes, most definitely. We  
25 have in fact had the Alyeska people in talking to our  
26 environmental people as well as our engineering people  
27 in regards to the types of concerns and the types of  
28 operations that they have progressed with on the  
29 Alyeska line.

30 Q Well, now if I can turn to

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2  
3 what you propose to do to educate the work crews. Have  
4 you devised a course for them?

5 A We haven't devised a course  
6 per se. No, it is a matter of tailoring the types of  
7 information to the different levels of people who are  
8 going to have to make use of it. I might say this is  
9 one of the reasons that the people who are within my  
10 own department at Foothills have the broad backgrounds  
11 they do. For instance, as I said in my direct testimony,  
12 Mr. Byers having had years of experience in pipelining  
13 and Mr. Lamb being an accomplished heavy  
14 equipment operator and job foreman etc.

15 Q Well, can I ask you then  
16 more specifically, what is your present thinking on  
17 the timing of the course, when it will be given to the  
18 employees.

19 A Sorry, I did not catch that.

20 Q What is your present thinking  
21 on the timing of the course; that is when it will be  
22 given to the employees?

23 A It will have to be given to  
24 select employees before they actually go into the field  
25 wherever possible. This is particularly in reference  
26 to the supervisory people. As far as application to the  
27 actual construction workers, the cat-skinners and so  
28 on, we really haven't arrived at a point where we can  
29 say when is the course actually going to be given, if  
30 we can in fact call it a course.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2  
3 Q I am just dealing now with  
4 the course to the work crews. I am not dealing with the  
5 course or any educational schemes you may have for  
6 supervisory personnel. And just dealing with the course  
7 that you propose to give to the work crews, have you  
8 given any thought to the training of the instructors?  
9 Do you want professional educationalists or do you want  
10 biologists or who do you want on that job?

11 A My preference would be to  
12 people who have a long suit of experience in the field  
13 and can appreciate both the academic or biological  
14 or physical environment aspects of the types of concerns  
15 and problems which may arise as well as having some sort  
16 of appreciation for what the actual construction worker  
17 and the supervisory personnel on the job are going to  
18 have to put up with.

19 Q Have you given any thought  
20 to when you would <sup>give</sup> the work crews their environmental  
21 education?

22 A No, that particular aspect  
23 of the program hasn't been developed to date. As I  
24 say, we are really in preliminary stages of trying to  
25 think out what would be applicable and how to approach  
26 it.

27 Q So, I can't obtain from you  
28 any concrete thinking now on that topic?

29 A Nothing more than you have  
30 already obtained, no.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

25  
26  
27  
28  
29  
30

Q Again, do you propose to  
look at what Alyeska is doing in that regard?

A Yes, most certainly.

Q Has any member of your staff  
done this already?

A As I said we have had some  
people from Alaska coming, come down to our shop in  
Calgary and give us a talk in regard to how the  
Alyeska program has progressed. Now, this one particular  
individual was a government employee, a state employee,  
in fact, on Alyeska who is involved in the state  
surveillance, environmental surveillance of the Alyeska  
project and we are progressing further with this and  
we do intend to go to the Alyeska project this spring  
sometime and spend considerable time there reviewing what  
is happening and how they are approaching similar  
types of problems.

Q All right, there may be  
some evidence later Mr. Bouckhout, sometime as to the  
contents of the Alyeska course. Are you able now to  
give us any view as to how you think it is working?

A No, I am afraid I am not.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 Q Well now, can I turn  
3 to your inspection staff, these are your environmental  
4 inspectors. I take it you propose a team of inspectors.

5 A At present I would  
6 think that's probably the best way to run it, yes.

7 Q And do you foresee a  
8 number of these inspectors that you will be hiring?

9 A A tentative number given  
10 my thinking to date I would foresee possibly somewhere  
11 in the range of 30 to 50 people, however, I must say  
12 that's very tentative and it's going to depend on  
13 the final makeup of the actual inspection staff and the  
14 inspection program per se.

15 Q And this is during the  
16 construction phase?

17 A This will be prior  
18 to the construction phase. I hope to get it started  
19 prior to the actual construction. In other words, in  
20 line with our pre-construction and so on we'll follow  
21 right through the construction phase.

22 Q And can you give us any  
23 idea as to how you propose to set up this team,  
24 where you propose to locate them and where they will  
25 be reporting to, and matters of that kind?

26 A Yes, I can give you a  
27 very general scheme now. Again this is based on my  
28 thinking to date, and by no means should it be con-  
29 strued as necessarily the final inspection staff or  
30 the final inspection scheme; but I would hope to have

people at each spread who would be responsible for both the physical and biological aspects of the program. Beyond that, the people in the individual spreads would be responsible to a district chief, there being possibly up to three districts that would more or less parallel the future operations and maintenance district. So it's in terms again from my thinking to date, the spread people report to a district head, who in turn report to a head of inspection or some such designation in head office.

Q And what type of training are you looking for?

A Again, it's going to be a matter of selection of the individuals who are best suited to this type of a program. As I said earlier, the type of people who we are going to require are people who can appreciate both ends of the stick and just don't have a very long suit in pure academics and can't appreciate construction or vice versa.

As far as the actual qualifications, it's really going to be a matter of qualification of merit, in other words we're not necessarily going to set a minimal educational standard, a Master's degree or a Ph. D. or anything like this. It's really going to have to be a selection on an individual basis.

Q And the man on each spread, what kind of power does he have?

A This is something again which hasn't really been finalized or worked out to

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence,  
Taylor, Beeves  
Cross-Exam by Ryder.

1  
2 date. As far as powers are concerned, he's going to be  
3 responsible to make sure that the measures which have  
4 definitely been designated, which are not optional  
5 measures but which are actually designated measures  
6 are going to be followed, and beyond that he would have,  
7 I would think, the power to adopt discretionary measures  
8 wherever necessary. This would obviously have to be  
9 done in consultation with his own immediate boss, be  
10 it the boss on the spread or boss at the district  
11 level. I really can't give you exactly again what  
12 power he's going to have. We've been thinking along  
13 these lines and a couple of fellows in our shop are  
14 presently charged with starting to develop this type  
15 of program, and toward that end as I said earlier,  
16 I'm very interested in the government's thinking, the  
17 various government agencies on this type of a thing  
18 since I would like to see this type of a program  
19 developed in concert with the ultimate government  
20 surveillance team, or government inspection team,  
21 since we can somewhat parallel our efforts and not  
22 duplicate efforts.

23 Q It would be useful to  
24 us, and I believe to the Commission as a whole, if we  
25 had some kind of proposal from you in this regard in  
26 more concrete terms, and the reason why I'm getting  
27 a little difficult with you on this, Mr. Bouckhout,  
28 is because in the week of September 15th this matter  
29 was raised with the previous panel of your company  
30 and I think Mr. Hollingworth said at page 9996 that

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 this is a serious matter and it has to be dealt with  
3 and they will be doing what they can, you would be  
4 doing what you could as a company to provide us this  
5 information so that we could adequately examine. I was  
6 wondering when you thought that you would be in a  
7 position to reveal your proposal to us so that we  
8 can have a look?

9 A Well, I really can't  
10 at this stage obviously reveal to you any proposal  
11 beyond what I've already said. This is our thinking  
12 on the matter and this is the way we're progressing and  
13 this is the line we're taking towards development of  
14 this sort of thing. Again I say that I have been in  
15 contact with some people in the Federal and Territorial  
16 Government agencies in hopes that we could perhaps  
17 get together on this development at an early stage  
18 so that we don't go our separate ways for some length  
19 of time and then have to come back to base one and  
20 have to knock it over. So that when we're actually  
21 developing this thing we're getting together on it.

22 Q May I just before leaving  
23 this topic ask you, to direct you, to obtain your  
24 views on a more concrete level. If in the field your  
25 environmental inspector proposes a remedy to maintain  
26 for example flow downstream of a stream --

27 A Sorry, to maintain what?

28 Q Flow level downstream  
29 of a stream that's being cut by the pipeline, and he  
30 proposes a method of doing this that may be somewhat

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 expensive and is challenged by the project engineer  
3 or his supervisor. Now who resolves that? I'm visuali-  
4 zing a situation where the project supervisor may  
5 look at a stream and see no fish there and say, "Why  
6 bother?"

7 A If it can't be resolved  
8 on-site at that particular level, it will have to  
9 go to a level beyond and in that regard I would say  
10 that our environmental inspections and our  
11 environmental inspection team would report through  
12 a hierarchy which is parallel to but not inter-related  
13 with the engineering/construction team per se.

14 Q So --

15 A So it has to reach an  
16 apex of one point if it cannot be resolved at  
17 succeeding levels up the ladder.

18 Q So until this resolution  
19 is arrived at, and the stream I take it does not get  
20 crossed?

21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 A It would really depend  
3 upon the necessity of an immediate decision. It is  
4 definitely possible that at one level the environmental  
5 inspection team, be it at the district level or head  
6 office level, would have the option of shutdown if  
7 necessary; but that, as I say, this is possible but we  
8 haven't written it in, it's not concrete or anything  
9 yet.

10 Q Well, if I can ask you  
11 to look at your application, 5 10 2, and I'll just  
12 read it to you, you say on page 72, 5-D, 5-72, do you  
13 have that? You can perhaps -- do you have that,  
14 Mr. Gibbs? At the bottom of the page in the last  
15 paragraph, 5 10 2 paragraph,

16 "Enforcement of Environmental Policy."

17 A I have it here.

18 Q Now, the sentence that  
19 I'm referring to,

20 "The applicant will employ a team of environmental  
21 inspectors who, in conjunction with spread  
22 superintendents will be responsible for enforcing  
23 environmental guidelines and regulations."

24 Now I take it the relationship between the spread  
25 superintendent and the environmental inspector hasn't  
26 been worked out?

27 A No, it hasn't, but it  
28 would be a parallel relationship, however. The environ-  
29 mental inspector, in other words, would not report  
30 to the spread superintendent.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
CrossExam by Ryder

1  
2 Q So they would have equal  
3 authority?

4 A They would have equal  
5 authority in terms of actually trying to resolve the  
6 problem which was not already resolved through appli-  
7 cation of a specific measure or specific regulation.

8 Q All right, and doesn't  
9 that really give the environmental inspector a veto  
10 power, or the right to stop work , simply by his  
11 refusal to agree?

12 A As I said, the environ-  
13 mental inspector at some level would essentially have  
14 this power, but we haven't designated at what level  
15 he would have the power yet.

16 Q Now, I take it that  
17 you would visualize -- can I ask you this question?  
18 In your view, can the environmental inspector, does he  
19 gain anything by being an engineer?

20 A What do you mean, "Does  
21 he gain anything by being an engineer?"

22 Q Just so he can be on  
23 practical terms with the project superintendent.

24 A He could possibly gain by  
25 being an engineer if in fact he had the background and  
26 the other aspects of the program which were  
27 necessary to appreciate the environmental concerns.

28 Q Before leaving this area,  
29 can you give us any indication as to when you think you  
30 might have your more concrete position available for us?

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1

2

A Well --

3

Q Before Phase 3 is finished?

4

A -- oh no, I wouldn't

5

think so. No, certainly it won't be before Phase 3.

6

This is a continuing thing which really has to be

7

determined in consultation and in a development stage.

8

This thing is being developed and I wouldn't say it

9

would be finalized until that ugly word final design stage.

10

Q It would be a little

11

difficult at that time to make it a subject matter of

12

this Inquiry.

13

A That's true.

14

Q Well, perhaps we can have

15

an argument on that later. Can I ask some questions

16

of Mr. Drew?

17

WITNESS DREW: I'll try to

18

answer.

19

Q Thank you, sir. Do I

20

understand correctly that your basic contribution, sir,

21

to this panel deals with your work on terrain, on your

22

terrain sensitivity rating?

23

A Yes, that is correct.

24

Q And that the use of this

25

terrain sensitivity rating is one of the ways in which

26

your application differs from the application of

27

Arctic Gas?

28

A Yes, very definitely.

29

Q Now, if I can ask you

30

some questions with respect to the role which your rating

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 can be used in the task of mitigating environmental  
3 harm. First of all, sir, the methodology that lies  
4 behind it. I'll just see if I can capsulize it, and  
5 you tell me if I've misread it. First of all, I  
6 understand that you've sub-divided the route into  
7 its various terrain units.

8 A Yes, I've done what is  
9 called terrain typing or mapping the surficial geolo-  
10 gical units and features and ~~phases~~ throughout our  
11 corridors.

12 Q And then you've assigned  
13 to each unit a sensitivity rating?

14 A Yes, a range of sensi-  
15 tivity ratings to the units

16 Q Correct, from one to  
17 four?

18 A Yes, that is correct.

19 Q Right, and that the  
20 basis of your rating is your prediction of the terrain's,  
21 the particular ~~arr~~ terrain's tolerance to environmental  
22 damage.

23 A I think it could be put  
24 that way.

25 Q So that rating No. 1  
26 would characterize a fairly robust terrain, that is  
27 more tolerant to environmental damage.

28 A Yes, it could character-  
29 ize a terrain that is tolerant to environmental damage  
30 either because it's robust or because it's something

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 that is, say you have a silty very active flood  
3 plain with stream flowing, well that's not robust;  
4 and if you go on it you're going to make tracks and  
5 things but then the water is going to fill those in  
6 and the tracks will soon disappear, so it would still  
7 have a low sensitivity rating even though it's not  
8 robust because it's quickly restored to its natural  
9 state.

10 Q I understand. Now, am  
11 I then correct in assuming that once the -- your maps  
12 have been completed and your rating system has been  
13 disclosed along the pipeline route, that the use to  
14 which these maps are put in determining environmental  
15 measures, protective measures, that is a subject  
16 matter which you don't deal with. That's something  
17 that Mr. Bouckhout or some others deal with.

18 A Yes, I think Foothills  
19 and geotechnical personnel and so forth would deal  
20 with this. This is just the foundation from which they  
21 work.

22 Q So your work is not to  
23 provide a remedy for environment protection itself but  
24 a tool to assist in the selection of a remedy.

25 A Yes, identification of  
26 relative sensitivity of terrains on a broad sense, not  
27 on a detailed sense for design.

28 Q Now I wonder if I could  
29 ask you or Mr. Bouckhout, some questions with respect  
30 to the precise use that has been made of your maps and

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 rating system up until the present time. First of all I  
3 take it that one of the potential uses is in the ability  
4 to select routes and alternate routes, along the  
5 Mackenzie corridor.

WITNESS BOUCKHOUT:

6 A That is used for instance  
7 selection of the  
8 in the/location of access roads, access roads from  
9 stockpile sites to compressor station sites, sir, to  
the line and so on.

10 Q All right, but to go  
11 back beyond that, were these maps available to you at  
12 a time when you were selecting your routes?

13 A Selecting the prime  
14 route, you mean, sir?

15 Q Selecting a route within  
16 the corridor, that turned out to be the prime route.

17 A This material has just  
18 been generated actually, I believe, after that. Actu-  
19 ally, Mr. Fawcett, who was here on the location panel,  
20 spoke to the actual application of terrain sensitivity  
21 in determining routes, and I'm not exactly sure how  
22 he described it. I'm not really sure at what stage  
23 they were available.

24 WITNESS DREW: As I remember  
25 that, my sensitivity ratings were not used primarily  
26 in determining the route. That was determined in  
27 other methods, as Mr. Bouckhout said, it will be used  
28 more for planning access ancillary facilities. Also  
29 another point, it would probably be useful for and I  
30 anticipate that Foothills would use it for is if, after

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
CrossExam by Ryder

1  
2 construction of the line, you have an emergency situa-  
3 tion, and have to go in in summer on the surface for  
4 emergency repairs or something, you could pick your  
5 routes on units of relatively lesser sensitivity.

6 Q But I take it that as a  
7 tool in route selection, Mr. Drew, it has an appli-  
8 cation.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2  
3 A A primary foundation application  
4 is certainly not to the design stage because there is  
5 much more detailed work done by people that follow and  
6 the geotechnical engineers and so forth and also our  
7 terrain typing as you know and as we have brought out,  
8 is not finalized yet. What you see on the alignment  
9 sheets is pre-field check terrain typing and of course,  
10 we have got a lot more information now and we are in  
11 the process of revising and improving upon, our  
12 alignment sheets will come out with a better typing and  
13 better estimate of terrain sensitivity before we are  
14 done.

15 Q Well, then I take it that  
16 until the present time they either haven't been used  
17 or they haven't been put in sufficient stage of com-  
18 pletion to be of much use to the work of the project  
19 to this stage?

20 A Work of the project in what  
21 way? They weren't used as a primary means of selecting  
22 the route.

23 Q Were they used at all in  
24 selecting the route?

25 WITNESS BOUCKHOUT: Yes, I  
26 believe Mr. Fawcett again as he spoke to this, and I  
27 am not sure exactly what he said, but I believe he did  
28 indicate at that time that they had been used in the  
29 selection of acces roads and so on.

30 MR. RYDER: No, we are talking

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2  
3 about the route, not the access roads.

4 A No, they haven't been used  
5 in selections of the route per se. If you are talking  
6 about terrain sensitivity now, the terrain typing and  
7 the terrain sensitivity are two things. Terrain  
8 sensitivity being an expansion or an addition to terrain  
9 typing. I believe terrain typing was certainly used  
10 in selection of the immediate route or the initial  
11 route.

12 WITNESS DREW: Oh, I might  
13 add on that one that terrain typing was used, terrain  
14 sensitivity numbers were on the legends of those sheets  
15 with the typing so it could have had some small weight.

16 Q Now, you mention the use  
17 of these, of your maps for the location of access roads  
18 to borrow pits and compressor stations. Have they been  
19 used for that?

20 WITNESS BOUCKHOUT: Yes, I  
21 believe they have. Again, Mr. Fawcett is the gentleman  
22 who is responsible for actually the final routing and the  
23 actual drawing of the route on the maps and I believe  
24 he indicated at that time that they had been used for  
25 that purpose.

26 Q Well, as the environmental  
27 chief, are you able to give us any specific examples as  
28 to where Mr. Drew's work has been used as a means of  
29 mitigating environmental problems?

30 A Beyond what we have already

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2  
3 said in terms of its use made by Mr. Fawcett, no I can't.

4 WITNESS DREW: I think most  
5 of the application of that will be in the future.

6 Q I am sorry?

7 A I think most of the  
8 application of my work to decision making will lie in  
9 future, when it is completed.

10 Q Well, now over to you Mr.  
11 Bouckhout. How will it be used in the future?

12 WITNESS BOUCKHOUT: Well, as  
13 Mr. Drew has already indicated, it has an obvious use  
14 in terms of determining the most applicable or the best  
15 ground access to a location where some repair may be  
16 necessary. All of our locations are not final. We  
17 have already talked about borrow sites, for instance,  
18 and certainly it has future use potential here in terms  
19 of selecting the actual alignment of the access roads  
20 to borrow sites, to compressor stations and so on.

21 Q Is it a tool that can only  
22 be used in the summertime?

23 WITNESS DREW: No, terrain  
24 sensitivity is most critical in the summertime. It  
25 could perhaps be used slightly in the winter terrain  
26 typing, more in the winter. For instance, if you have  
27 some exposed sand dunes that are so exposed that the  
28 wind blows the snow off and they are dry, well they will  
29 have some terrain sensitivity even in the winter. And  
30 the sand dunes are mapped on our alignment sheets,

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

usually with the sensitivity rating of two and they are one of the rare cases where the sensitivity is not going to decrease significantly with winter, if they are exposed enough so that they are snow free and dry.

Q I think I read somewhere on your map that it refers to summer sensitivity?

A Yes, it does and then in the notes at the bottom, I believe, it is explained the example I just gave of sand dunes or something or somewhere in one of our texts, it is explained or some notes on the bottom explaining the terrain sensitivity legend and I think that is where it explains that usually that terrain sensitivity in winter is low, except in cases, such as sand dunes and other well-drained deposits that are not frozen and consolidated in the winter.

Even the scarp on the edge of a gravel terrace could have terrain sensitivity in the winter because that gravel bank could cave in if you trespass along the top edge of it.

Q Dealing with the manner in which you are going to use these documents, Mr. Bouckhout, do you propose to use the documents as a means of selecting the routes or rather the access roads between say, a compressor station and the line? Or would you use it after the preferred route where the access road has been selected and then use it to assess the acceptability of the access road?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 WITNESS BOUCKHOUT: I think it  
3 has to be used at both stages. Obviously in the selection  
4 of the access road, it would constitute one of the data  
5 basis for selection of that particular access road.  
6 Obviously you have to take into account a degree of  
7 slope and length of the road and the type of vegetation  
8 along the particular access and so on, so it is really  
9 used as one of the tools or one of the data basis at  
10 the selection stage.

11 Q So, I take it then that at  
12 the beginning, when you are selecting a route for an  
13 access road, what you do is draw acceptable routes from  
14 a terrain rating basis and you can compare them with  
15 respect to other environmental considerations that may  
16 be obtained in any particular area?

17 A I don't know exactly how  
18 it done. Again, I am not the individual who draws the  
19 lines on the map. Our route locator or whatever  
20 terminology you would like to use, is the fellow that  
21 actually uses this information to draw the lines on  
22 the map where the access roads will be and he takes  
23 into account things like terrain sensitivity and things  
24 like slope and so on.

25 Q He will be an engineer?

26 A I am not an engineer sir.

27 Q He will be though?

28 A He is not an engineer. He  
29 is a surveyor, sir.

30 Q Well, now what do you then

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1

2

do with these documents as an environmental manager?

3

A For these particular

4

documents, I do have some input into the selection of

5

routes and so on but as I have mentioned the prime

6

user of this particular information is the fellow who

7

actually draws the lines on the map. It certainly has

8

potential future use as we have already indicated in

9

terms of designating routes for contingency repair in

10

the summer and so on.

Q I'm not really sure from  
your answer whether this is an environmen<sup>t</sup>al tool or a  
tool for the environmentalists, or whether it's a tool  
for the surveyer.

A Well, it's an environ-  
mental tool but it's not necessary that you be an  
environmentalists to use an environmental tool.

O Mr. Lawrence, can I ask  
you some questions so that you can be off as soon as  
convenient? With respect to disposal of sewage, and  
I take it that your evidence in chief describes the  
proposals of both the applicants.

WITNESS LAWRENCE: That is  
correct.

Q And with respect to  
sewage, disposal of sewage and solid wastes.

A That is correct.

Q Those two areas, and do I  
understand from Mr. Marshall and Mr. Carter -- Mr.  
Marshall is not here -- that Arctic Gas has agreed to  
be bound by the answers in this regard by Mr. Lawrence?

A I believe that Mr. Hom-  
stock provided direct evidence himself and gave the  
answer to many of the questions which were put directly  
to them. I believe, though, you're correct that  
both parties would be accepting my evidence in the  
in which it's given.

THE COMMISSIONER: I think we  
should proceed as if Mr. Lawrence had given evidence as

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 a witness on behalf of Arctic Gas.

3 MR. CARTER: On the understand-  
4 ing that he's a consultant and not a spokesman for  
5 Arctic Gas, in the same sense as Mr. Hemstock.

6 MR. RYDER: Well, we did  
7 defer our questioning on this subject matter.

8 THE COMMISSIONER: As if he  
9 had been called by Arctic Gas.

10 MR. RYDER: Yes.

11 Q Now, I take it from your  
12 evidence in chief, sir, that dealing with the disposal  
13 of waste water from construction camps that your target  
14 is secondary treatment.

15 A That is correct.

16 Q And that you propose two  
17 methods essentially for achieving this. The first is  
18 the mechanical treatment plant which would have some  
19 form of backup, and the second is open lagoons.

20 A No, no, we propose that  
21 a lagoon system would be used as a backup arrangement,  
22 but the primary tool in every case would be a mechanical  
23 plant, and we suggested that we have two types of  
24 these types of plants, and the final designation of  
25 those has not been decided.

26 Q All right, so that that  
27 does clarify a problem to me. Your proposition then is  
28 that <sup>there</sup> be one method of achieving your target of secondary  
29 treatment, and that would be the mechanical treatment  
30 plant .

A That is correct.

Q And you just haven't  
selected the type of mechanical treatment plant .

A That is correct.

Q And each mechanical  
treatment plant would have some form of backup. I  
call it a retaining pond, but I suppose it's the  
same idea.

A That is correct, yes.

Q Now, and so open  
lagoons do not form part of your proposal.

A No.

Q All right now, I wonder  
if Mr. Carter can assist me because if I look at the  
evidence in chief of his panel, the -- at page 36 the  
basic treatment is described as open lagoons, and the  
package plants are relegated to an alternative proposi-  
tion, and I just don't know when I'm asking Mr. Lawrence  
these questions whether I have the real position of  
Arctic Gas in my mind.

MR. CARTER: Well, Mr. Hemstock  
will be back and can speak to the policy of Arctic Gas,  
but you can put the questions to Mr. Lawrence as to what  
his advice to Arctic Gas is as consultan t.

MITNESS LAWRENCE: Our advice  
to Arctic Gas was a mechanical plant with a retention  
pond, retaining pond as a backup, with disposal onto  
land.

MR. RYDER: All right, and

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 you've outlined a number of the problems with respect  
3 to lagoons, I think to Mr. Bayly the other day, and I  
4 gather that one of the problems is that there's a  
5 tendency in permafrost areas, and ice-rich permafrost  
6 areas, for thaw bulbs to form beneath the lagoons,  
7 the bed of the lagoons.

8 A That would be correct.

9 Q And that that causes  
10 settlement in the ground beneath the --

11 A I think, sir, the propo-  
12 sition would have to be a very site-selective one where  
13 if you were into a high ice area you would avoid that  
14 type of construction. Now, on the diagrams have been  
15 shown as a typical site, they have shown a bermed  
16 type of construction and this would not necessarily  
17 be used in that type of an area.

18 Q Well, I take it that  
19 your recommendation is that it should never be used in  
20 an ice-rich permafrost area.

21 A Yes, but then you could  
22 still have a retention pond similar to the one that  
23 Imperial Oil have at Tuktoyaktuk, which is totally  
24 excavated.

25 Q How large a pond is that?

26 A It's quite small; it's  
27 meant for a camp of only 50 or 60 people.

28 Q All right, I'm dealing  
29 with lagoons as a method of waste disposal for large  
30 permanent camps of up to 500 to 800 men.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 A In ice-rich areas we  
3 would avoid a type where you would go into a berm type  
4 of construction. It would be far better to use natural  
5 features insofar as you can.

6 Q So then, if I can ask  
7 you, Mr. Bouckhout, do I take it that you're prepared  
8 to accept Mr. Lawrence's advice on that, that there  
9 won't be any large lagoons in ice-rich permafrost  
10 areas resulting from your project?

11 WITNESS BOUCKHOUT: This, of  
12 course, would be subject to review by various people,  
13 including our geotechnical people, in regards to  
14 what the potential repercussions would be of having a  
15 lagoon in such a location, and as Mr. Lawrence has  
16 indicated, it's really a matter of site investigation  
17 and site specifics.

18 Q Well --

19 A So I can't say carte  
20 blanche right now that in continuous permafrost zone  
21 there would absolutely be no lagoons.

22 Q Is there any doubt that  
23 in an ice-rich area that a lagoon for a large camp  
24 is unworkable?

25 A Are you asking me, sir?

26 Q Well, I think I should  
27 ask perhaps Mr. Lawrence.

28 WITNESS LAWRENCE: It  
29 certainly would not be my recommendation that you  
30 would take any portion of high ice and try to contain

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 a warmed water within it. I think that in each case  
3 that I have examined, where I have looked at this  
4 type of thing, generally speaking you would attempt  
5 to use the natural feature, either do away with the  
6 retention pond as such and use a very small pot-hole  
7 slough that exists. You hit many of these in the  
8 tundra area, or even further south; but to avoid con-  
9 struction which has to be worked over later or aban-  
10 doned with additional work going into the abandonment.  
11 Where lagoons can be built in an orthodox fashion,  
12 we would use them; where they cannot, we would just  
13 have to use natural features.

14 Q All right, so if Foot-  
15 hills accepts your advice then, I take it, there won't  
16 be any large lagoons constructed in ice-rich areas  
17 which will require continued maintenance to maintain  
18 the berm.

19 A That is correct.

20 Q All right, and dealing  
21 with -- there is -- dealing with a suggestion that  
22 you made that you would use smaller retention ponds  
23 from natural features, do they -- would that use not  
24 create problems in the restoration of these features  
25 after the camp is abandoned?

26 A It may for a short  
27 period of time. I think, though, that the least less  
28 work you can do on it, the quicker the restoration  
29 will be.

30 Q You answered some

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 questions last time, I believe, Mr. Lawrence, with  
3 respect to the mechanical treatment plants and I think  
4 it was agreed, was it not, they present a highly  
5 specialized piece of equipment which require highly  
6 trained personnel to operate them?

7 A Reasonably high, yes,  
8 but still within the capabilities of trained techni-  
9 cians.

10 Q Yes, and that each module,  
11 I take it these plants come in modular form.

12 A Yes, they ~~have~~ a limited  
13 capability and therefore you have to limit the number  
14 of people that you assign to each one.

15 Q All right, and that when  
16 that particular plant isn't large enough to accommodate  
17 the demands placed upon it, then another plant can be  
18 installed beside it.

19 A That is correct.

20 Q And that each plant or  
21 module **requires** its own back-up unit.

22 A No, not necessarily.  
23 You could have, just for example, an 800-man camp with  
24 four of these modules, but served into a single reten-  
25 tion unit.

26 Q And what happens if all  
27 four plants go out at the same time?

28 A That's rather unusual,  
29 I would think. But I think I also ~~pointed~~ out that  
30 the material we're dealing with is not a dangerous

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

substance and there are many, many examples where short  
and long periods of time sewage in its rawest form  
has been deposited into the environment without any  
lasting damage.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

Q Well, I take it that the purpose of these back-up units is really two-fold and one is to provide further treatment and that does take place, does it not?

A That's right.

Q And the second is that to provide a back-up in case the module breaks down or the plant breaks down.

A In case the module breaks down or there is a lapse of something in the either the operation or lack of material, lack of supply in the biological units, it takes a little while for them to start their proper action. This type of thing would then provide the aid treatment until that unit comes up with proper operating capability.

Q Now, where the plant is broken down, I take it that the back-up unit would be receiving raw sewage?

A That is most likely, yes.

Q And, when that is done and the module is placed again in working condition, what does one do with the sewage that has been emptied into the module, into the back-up unit?

A It is left there.

Q No process of taking it out and putting it back into the plant?

A No, I don't think this is a requirement unless it's a very extended one but I don't see that as being a thing that I would recommend

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 at this stage of the game.

3 Q I suppose it would  
4 depend how long the break-down lasts because you would  
5 have in the retention pond sewage which is not receiving  
6 treatment that will achieve your target.

7 A These units use very  
8 basic methods of treatment for primary treatment and  
9 unless the unit itself, unless the tank itself is taken  
10 out of service for some reason or other, then the  
11 sewages always receive primary treatment which  
12 means a removal of floatable or settleable solids.

13 Q In your evidence in  
14 chief at page 39, you refer to another form of back-up  
15 but you don't describe what that is.

16 I think you say that in  
17 most cases, your back-up treatment will be retention  
18 ponds and apply the use sometimes of other forms of  
19 back-up.

20 WITNESS BOUCKHOUT: A Which  
21 part of page 39 is that, sir?

22 Q Paragraph 4 on page 39.  
23 You say in most cases  
24 this would be in the form of retention ponds.

25 WITNESS LAWRENCE: A I  
26 think I was talking in terms of multiple units where  
27 the unit from one module which could be used as a back-  
28 up for a second module. The other thing that we would  
29 certainly have would be the time-honoured thing of  
30 having duplication of some essential equipment. For

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

instance, two blowers on a biological unit. That type of thing.

Q Can you outline the recommendations you expect to make to your client with respect to the restoration of retention ponds after you are done with them?

A Oh, I think actually if we had a constructed retention pond at the compressor station sites, it was our recommendation that that pond would be left in existence to serve as a complete treatment unit for continuing operation. I think I have pointed out in both reports that using mathematical figures you could show that a short retention period say 10, 15 days for a large camp would be equal to a year's retention for the operation or maintenance people on the compressor units.

So that, for the continuing operation the pond would be left in existence and could well become the sole treatment unit. This would be an addition to say a holding tank which would be in the whatever quarters was left at the compression-- at the compression station site.

We had stated that the mechanical units may be left in on the compressor station sites too but generally speaking unless this was started up again for a fairly extended period of time, the sole treatment unit would be the pond.

Q Well, there will be some retention pond at sites that are to be totally

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves,  
Cross-Exam by Ryder

1  
2 abandoned that aren't associated with compressor  
3 stations. Now, what do you propose when sites of that  
4 kind are abandoned?

5 A Well personally, I have  
6 given very little thought to that. I would think it  
7 would be almost the same procedure as abandoning  
8 part of any gravel pad. If there was a berm, I would  
9 think you would certainly either spread it or remove  
10 it. I think if it contained good gravel for instance  
11 the good gravel would be salvaged and taken away.

12 Other than that you would  
13 flatten, possibly cover with material that would grow  
14 grasses and have it restored in that fashion.  
15 And that permitted to go back to natural vegetation.

16 Q What about the sludge  
17 that has settled to the bottom of the pond?

18 A Well, this in itself isn't  
19 bad material for growing things on. I don't think I  
20 would attempt to remove that at all.

21 Q And the liquid on top.  
22 Would you keep that as well?

23 A Well generally speaking,  
24 the liquid is drained off.

25 Q Now, We have heard some  
26 evidence that a large quantity of water will be con-  
27 sumed on a daily basis by your clients in these con-  
28 struction camps and I want to ask you some questions,  
29 if I may, with respect to any problems that you may  
30 see associated with discharging large quantities of

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 water after they have been used? Now, we have had  
3 evidence from your client, Arctic Gas, that they  
4 propose using 800, sorry, 80 gallons per man per day  
5 and in an 800 man camp, that comes to 64,000 gallons.  
6 And it could be higher. I think Mr. Williams for  
7 the Arctic Gas panel indicated that it might be higher.

8 Now, how do you plan to  
9 dispose of that water after you have -- after it has  
10 been used?

11 A Oh, I thought that was  
12 the whole point of the sewage collection, the treatment  
13 and disposal system.

14 Q That's processing the  
15 material, isn't it. After you have processed it, what  
16 do you do with it?

17 A Well, then you're talking  
18 last of the small retention pond?

19 Q Well, I take it that the  
20 quantities to be disposed of will be similar to the  
21 quantities consumed. The water coming in to the camp  
22 will become sewage and will have to be discharged.

23 A That's right.

24 Q And have you considered  
25 and I understand your evidence that you propose to  
26 discharge this liquid or this water on to ground onto  
27 the ground and into streams and perhaps into the ocean.

28 Now, is that related  
29 to the three areas of discharge?

30 A Well, we want to avoid

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 discharging into the bodies of water wherever possible.  
3 I don't think this would preclude the ocean. And again  
4 I am talking of treated sewage.

5 Our recommendation was  
6 that wherever possible that this be discharged on to  
7 swampland or wet land.

8 It then spreads out and  
9 becomes part of the natural environment.

10 Q Right. Now, Mr. Bouck-  
11 hout, have you considered the biological effect of  
12 discharging large quantities of water into swamp?

13 Now, I understand that  
14 swamps are not necessarily the lowest level of the  
15 environment, that they may be unpleasant to people but  
16 they are very active and there are other things that  
17 live in the area.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 A Mr. Lawrence, has already  
3 indicated in previous examination that swamps have been  
4 used extensively for this particular purpose and as such  
5 have operated quite effectively in terms of negating  
6 any serious impact of this particular material on the  
7 environment for any space or distance. As Mr. Lawrence  
8 has indicated, we would very much try to avoid disposal  
9 of this material in any water body, per se, such as  
10 a lake or a stream.

11 Q Dealing with swamps, has  
12 Foothills considered the biological effects of dis-  
13 charging large quantities of water and so on?

14 A We have certainly, I believe,  
15 through Dr. Lawrence, I think, considered this to some  
16 extend in regards to Dr. Lawrence's experience with  
17 this particular method and the experience of other  
18 investigators who have written on this particular type  
19 of method. For instance, the town of Hay River dis-  
20 charges into a swamp land sort of affair and this has  
21 been studied fairly extensively by various biological  
22 people.

23 Q And as a result of your  
24 studies, what effect can you predict?

25 A This is not a result of our  
26 studies. This is a result of studies that have been  
27 done, for instance, relative to the environmental  
28 social program.

29 Q As a result of the studies  
30 you have looked at, what consequences can we predict?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 A I personally don't know. I  
3 haven't evaluated it. The people who would be primarily  
4 concerned with this particular aspect of the program  
5 would be Mr. Lawrence and our aquatic biologists, for  
6 instance, who would have to evaluate the particular  
7 location where this material is to be discharged.

8 Now, this is again a site  
9 specific detail which has to be looked into when you  
10 are determining the actual ultimate end of the material.

11 Q Well, site specific or not,  
12 it is proposed that you discharge large quantities of  
13 water in swamps? I want to know whether you studied  
14 the consequences of your proposition?

15 WITNESS LAWRENCE: I think that  
16 has been looked at in other areas. In actual fact, Hay  
17 River is one which was quoted but others such as Camp  
18 Takhini at Whitehorse and the effects are that there is  
19 a greater growth due to the nutrients inherent within  
20 the sewage itself.

21 Q That's the greater vegetation  
22 growth?

23 A Yes, greater vegetational  
24 growth and possibly a flourishing of some types greater  
25 than others or more than others.

26 Q Now,--

27 A But, nothing detrimental.

28 Q Your discharge will occur  
29 during the wintertime?

30 A That's correct.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1

30

Q And can you really say that nothing detrimental will occur to the beaver and the muskrat that lives in the swamp?

A Well, again we would avoid places where the beaver and the muskrat are. We are talking about wet lands, we are not talking of lakes and sloughs.

Q So, your selection of swamp areas will depend on what you find there when you go to the site?

A I would think that the biological people would be most reluctant to allow us to use a swamp or land inhabited by muskrat or beavers for that use. We are capable of piping this for reasonably long distances.

Q So, you could vary the location of the--

A That's correct.

Q All right. The problems that suggest themselves for the moment, and I wonder if you, maybe your not the person to ask. For example, the air holes of some of these animals could have been covered up as the ice freezes and builds up a layer of ice over the swamp land area.

A Well again, in my experience, this type of animal wants free water. It is not looking for swamp land. Beaver and muskrat live in lakes and ponds where there is free water under the ice.

Q I believe it was last

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 Thursday or Friday, page 13117, you did indicate the  
3 areas of discharge would include land and streams or  
4 into the sea?

5 A This was on one particular  
6 site, yes.

7 Q Komakuk Beach?

8 A Yes.

9 Q Well, now that is one  
10 exception. I am really trying to determine what  
11 you can tell me about your plans for discharging into  
12 streams. You told me a minute ago that you weren't  
13 proposing to do so and now I believe you are suggesting  
14 that you are in some exceptions. Are there others?

15 A No, I think I was trying to  
16 describe the problem of coming up with a positive  
17 solution without having seen the site and having merely  
18 looked at a large scale map and seeing that there is  
19 a coastline, there are some streams and some swamps in  
20 the area. My evidence was that these three possibilities  
21 existed. Again, just to clarify that thing, if we were  
22 right on the coast and there was a small stream or  
23 something like that that the biologists said was not  
24 useful for other types of animals and I am thinking more  
25 of a wash-out and I think that's what that thing is.  
26 It is not really a stream. I wouldn't hesitate during  
27 winter months to deposit treated effluent into that  
28 stream. I would presume in that case, we would be in  
29 the last 200 feet or 300 feet of the stream before it  
30 hit the ocean.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 Q All right. Now, can I ask  
3 you to address the problem of garbage removal and  
4 destruction and I am concerned about the garbage  
5 generated by the lunch remains of employees who work  
6 along the pipeline route and maybe at construction sites,  
7 such as compressor stations during the summertime. There  
8 will be some summer construction work going on I take it?

9 A Right.

10 Q And I understand that any  
11 presence of loose garbage provides an immediate attraction  
12 to bears and foxes in the neighbourhood, which can  
13 become a nuisance and have to be destroyed? Now have  
14 you addressed that problem?

15 A Yes, only as a matter of  
16 principle though. But I think the solution to this is  
17 already being adopted and used by the various seismic  
18 camps, drilling camps in the areas where they have  
19 mobile incinerators taken right along with the crews and  
20 used everyday. Garbage is not allowed to lay around and  
21 attract both flies and animals.

22 Q So, I take it Mr. Bouckhout  
23 then, that any inclination that one might have of  
24 throwing an apple core into the woods or off the site  
25 somewhat, would be forebotten?

26 WITNESS BOUCKHOUT: Well, yes.  
27 I think we are going to have some difficulty controlling  
28 every apple core, but certainly as a general rule, we  
29 will definitely collect this material and incinerate it.

30 Q Have you investigated the

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder

1  
2 Alyeska experience on this particular problem?

3 A Personally no, I haven't.

4 Q Because I understand that  
5 it was a recurring problem there that seemed to occupy  
6 a great deal of the staff, the time of the staff for  
7 both General Rollins and Mr. Champion.

8 A I can certainly appreciate  
9 that it could be a potential problem. You just have to  
10 look at our National Parks to realise how big a problem  
11 it can possibly be.

12 Q In a seismic or drilling  
13 camp situation, isn't that quite a different proposition,  
14 Mr. Lawrence, than men who are working out along the  
15 pipeline route? In the seismic camp or drilling camp,  
16 the men are never very far from the base where the  
17 dining facilities are? Whereas a pipeline, they are  
18 strung out along the whole route for the rest of the  
19 whole day?

20 WITNESS LAWRENCE: Yes, I think  
21 keep in mind though that this again is wintertime con-  
22 struction that we are talking about along the pipeline.

23 Q Well, there will be some  
24 construction activity?

25 A I would have to agree that  
26 this is a problem and I think again like most garbage  
27 is a problem, the solution to the problem is one of  
28 policing. Just the exactly the same as in any com-  
29 munity.

30 Q The problem in the wintertime,

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 I take it, is with regard to animals that don't  
3 hibernate?

4 A Right.

5 Q Like the fox.

6 A I think the pipeline, as I  
7 know pipelines, the solution is there and that such  
8 materials, the natural place to throw things is back  
9 in the ditch, particularly organic things in paper bags and  
10 soon it is covered up.

11 Q Now, can I turn to page  
12 40 of your evidence in chief, with respect to the  
13 disposal of non-organic wastes. And you speak at the  
14 bottom of page 40 in response to question 8, that a  
15 large variety of items will be collected and buried at  
16 an approved site by an approved method. Now, can I  
17 ask you what you meant by approval in that sentence?

18 A I think the basis of my  
19 reply here goes back to the various governmental  
20 directives and literature that they have provided for  
21 the pipeline guidelines and in there, in many cases,  
22 they speak of having centralized dumping grounds and  
23 also methods for disposing the wastes, rather than  
24 have them spread out all over the place to make sure  
25 that the policing of such, that they are collected in  
26 central locations and either buried or covered up or  
27 disposed of at one place instead of thousands of places.  
28 It is an extension of the program that they have been  
29 carrying on themselves over the past few years.  
30

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 Q I take it the main  
3 criteria for concern to be addressed in this area  
4 is the methods you have for operating this site  
5 while it's open, after you've selected it, while it's  
6 open and while it's receiving these materials.

7 WITNESS LAWRENCE: Yes, I  
8 would think that any site selection would be done  
9 really by the Environmental Protection Service people  
10 in consultation of course with the people that are  
11 working there; but again the criteria would be to make  
12 sure that they have a collecting point rather than a  
13 spreading out of solid wastes all over the landscape.

14 Q Are animals a problem  
15 with respect to the operation of sites of this kind?

16 A Of the type of wastes  
17 that we would be putting there would be non-organic  
18 and I don't think the animals would be a problem.

19 Q Have you considered  
20 what you propose doing to restore these sites after  
21 you've finished with them?

22 A Yes. Well, I think that  
23 we say "approved methods", and generally speaking I  
24 think that for those materials which are not going to  
25 be taken back for recycling, which are going to be  
26 left on that site, I can only assume the approved  
27 method will be covering them up with material, burying  
28 them.

29 Q So that is the method  
30 that you propose or advise?

A Yes.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1

2

3

Q Do these sites have to  
be marked after they've been used?

4

5

6

A Yes, that is also one  
of the criteria they have, that these sites be marked  
for future generations.

7

8

9

10

11

12

13

Q Why is that necessary?

A Well, so that people

establishing a new site three or four years down the  
line can use the same site rather than start opening  
another one. Secondly, so that people digging into  
them won't be surprised when they find a derelick  
engine pump or wire.

14

15

Q They won't mistake it

for an archaeological site.

16

17

A I question whether the

sign would last.

18

19

20

21

22

23

24

25

26

27

Q Well, thank you, Mr.

Lawrence. Before I leave this area it might be  
useful to refer specifically to the page in -- and a  
portion of the evidence in chief of Arctic Gas Phase  
2 panel, that appears to be different from the proposal  
and the recommendations that you're giving to that  
client. So that the record can be straight as to  
the source of my perplexity, and that is at page 36  
paragraph (b), if I could just ask Mr. Carter to note  
that --

28

29

M R. CARTER: Paragraph ( b)?

30

Q (b), maybe I can ask you  
to comment on it, Mr. Lawrence. Perhaps if I can read

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 it to you, it states:

3 "For camps occupied on a year-around basis, the  
4 treatment  
5 basic water waste water /component will be  
6 open lagoons with a one-year retention capacity.  
7 Such units are in successful operation in many  
8 northern communities. They are economical and  
9 require little maintenance by producing quality  
10 effluent. Where lagoons are not practicable,  
11 packaged mechanical treatment units capable of  
12 providing secondary treatment will be installed."

13 Now that's the proposal in the Phase 2 panel, Arctic  
14 Gas, that does appear, am I not correct in saying, to  
15 be the reverse of your proposition?

16 WITNESS LAWRENCE:

17 A No, I think it is  
18 exactly the same. What I have said there was that  
19 for the construction camps occupied on relatively  
20 short term, the mechanical plant would be the basic  
21 unit. Where we go into compressor station sites,  
22 where the operation continues year after year after  
23 year, the lagoon which was a relatively small unit,  
24 and might be the same short retention pond that was  
25 used in the construction period, would be the basic  
26 unit.

27 Q If I could just stop  
28 you for a minute, what we're dealing here is the methods  
29 for camps occupied on a year-around basis.

30 A But the only ones that  
will be occupied on a year-around basis are those on  
the compressor stations. There's no other camps.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 Q What about camps at  
3 stockpiles?

4 A Well, they would dis-  
5 appear at the end of construction.

6 Q And until then they  
7 have a two or three-year continuous use?

8 A That is correct.

9 Q And would they fall into  
10 that category as you've described here?

11 A Well, again without  
12 knowing the specific instance, my recommendation is  
13 that they would follow a mechanical treatment plant  
14 use, with a mechanical plant being the prime unit and  
15 possibly a backup type of lagoon.

16 MR. RYDER: If I may have the  
17 Commission's indulgence for a moment?

18 I'd like to ask Dr.  
19 Reeves some questions about archaeology.

20 MR. GIBBS: Perhaps Mr.  
21 Lawrence could be excused, sir, if Mr. Ryder is going  
22 onto archaeology.

23 THE COMMISSIONER: Well, you  
24 feel free to go and get it whenever you want to go and  
25 get it.

26  
27 MR. RYDER: Q Now, Dr. Reeves,  
28 at page 47 you refer to known sites that are adjacent  
29 to or nearby the pipeline route, and I believe one  
30 of your concerns you've noted is that they may be

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 impacted by acts of vandalism.

3 WITNESS REEVES: That is  
4 correct.

5 Q And so your solution is  
6 to integrate these sites into your general archaeological  
7 program.

8 A Yes.

9 Q Right, and what does that  
10 mean? What form of protection will be provided by  
11 doing that?

12 A By monitoring the sites,  
13 by designating them, putting the sites into the  
14 educational or, excuse me, informational or other  
15 programs designed to acquaint the personnel with the  
16 site, with its value, and to attempt to ensure that  
17 they do not vandalize it. Also, they are protected  
18 under Statute.

19 Q So that by your  
20 education program the work crews will be familiar  
21 with the location of the site.; and then by your  
22 surveillance and monitoring program you protect the  
23 site.

24 A Most of these sites  
25 are already known. I think I should perhaps, to  
26 qualify it a little bit we 're talking primarily about  
27 the outstanding sites, such as an example site.  
28 These are known today. We can advise them and designate  
29 them and <sup>in</sup>form the personnel to avoid them. So you're  
30 quite correct, they will become aware of the existence

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 of them.

3 Q Do you propose, when  
4 you say "monitoring these sites", does that mean you  
5 will have people present to protect them when the  
6 pipeline is proceeding nearby?

7 A They would be checked,  
8 I would visualize them being checked during construction  
9 periods, for evidence of such activities as vandalism.

10 Q And how will that  
11 protect the sites?

12 A It would identify if in  
13 fact people are vandalizing the site, and perhaps some  
14 sort of measures can be taken to stop this.

15 Q And those measures, I  
16 take it, would be an increased form of surveillance?

17 A Yes, and also discussions  
18 to identify the parties responsible. Site protection  
19 is a very difficult problem no matter where we are.  
20 It's very difficult. Hopefully it will be less diffi-  
21 cult here than it is south.

22 Q Do you visualize, Mr.  
23 Bouckhout, staffing and financing a surveillance team  
24 for that purpose?

25 WITNESS BOUCKHOUT: This would  
26 very much depend upon the recommendation of Dr. Reeves,  
27 the particular site involved and so on. Certainly it  
28 is a possibility to be considered. Of course again,  
29 dealing with winter construction, the sites won't be  
30 particularly evident, nor will they be particularly

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 accessible, so that shouldn't present a great deal of  
3 problem in regards to the winter construction phase.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

Q I take it that, Dr. Reeves,  
the  
where the pipeline crew is in vicinity of an outstand-  
ing site that hasn't yet been excavated, that it would  
be your judgment to avoid excavation of that site  
where at all possible.

WITNESS REEVES: A That  
is correct.

Q And I understand that I  
am just repeating the contemporary wisdom of your  
field that excavation is to be avoided unless it  
is necessary to preserve the site from destruction  
or unless the excavation forms part of a planned  
scientific overall scheme and the information from  
that site is necessary.

A Yes. We had to consider,  
of course, cost of avoiding the site versus excavating  
the site.

Q Well, I'm now dealing with  
the sites that aren't necessarily going to be disrupted  
by the passage of the pipeline. Now, can I turn to  
your plans for locating sites along the pipeline  
route before the ditching machine starts its work?

Can you outline those  
plans for us?

A Yes. The plans would  
consist of essentially two major steps; the examination  
of areas prior to / finalization which are particularly  
archaeologically sensitive. I should say, qualify that  
in saying potentially. That is, areas which may well

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 contain archaeological sites, river crossings, inter-  
3 sections of lakes, etc. This would be done before  
4 there was any clearing.

5  
6 The second major phase  
7 of site identification and location would be after the  
8 line has been cleared and prior to ditching to identify  
9 sites which could not be located prior to that.

10 Q All right. And I think  
11 in response to Mr. Bayly's questions last week, you  
12 indicate that there are sites that we're dealing with  
13 fall into two broad general categories.

14 The first category is  
15 sites of more recent vintage that can be detected by  
16 examining topographical features in the landscape that  
17 you can see exist and then that's the first category.

18 And the second  
19 category is sites that are older and more deeply buried  
20 that were located by reference to topographical  
21 features that no longer exist. Have I correctly -- ?

22 A That's essentially  
23 correct.

24 Q All right. And during  
25 the course of your discussion with Mr. Bayly, you  
26 indicated that there will be a -- you mentioned drilling  
27 along the route as a means of detecting the older  
28 sites.

29 A I believe Mr. Bayly  
30 mentioned that.

Q All right.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

A As a possible method.

Q Yes. And that drilling  
that, I gather you understood him to be referring  
to is drilling that takes part in the course of the  
pipeline construction. It's not designed specifically  
to locate archaeological--future archaeological dates.

A Can you give me the  
page number on that?

Q Page 13,080 just before  
Mr. Bayly started talking about Little Jack Horner  
putting his thumb into the pie. He deals with --

A I have the page.

Q At the top of the page  
with the drilling program. Now, the drilling program  
that I take it is referred to there is the construction  
pipeline running from there which may as an added bonus  
reveal some artifact?

A I believe I would  
interpret Mr. Bayly's question to refer to that but  
we would also in certain areas of particular  
interest to us do drilling or augering, searching for  
subsurface remains deeply buried.

Q Now, does that form part  
of your firm program for Foothills?

A Yes.

Q And is that to be done  
after a study of some kind of topographical map that  
will indicate the previous landscape that is not  
visible to -- ?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

A No, that would have to  
be done after both study of aerial photos, past  
environmental data, and field investigations.

Q So that is a firm  
undertaking that will be done by -- ?

A That's if such areas do,  
in fact, exist, that require that type of work.

And, I believe it's in  
the impact in the statement of Foothills that subsurface  
prospecting will be used. Q: And, dealing with evaluation  
of sites that have been discovered, prior to ditching  
operations, I take it that the discovery will take place  
during the summer following the clearing of the  
pipeline route?

A Yes.

Q And, at that stage, do  
I understand correctly to say that the pipeline company  
really has three options when a site is located. The  
first option is to consider moving the line if the  
site is sufficiently important -- if you can persuade  
them that the site is sufficiently important.

The second option is to  
salvage the excavation, to do a salvage excavation  
before the drilling machine or the site is destroyed  
rather by the ditching machine.

And the third option is to  
simply flag a site and return to it after the pipeline  
has been laid. Are those generally the three options  
that the company has available to it?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

A In general yes. However,  
the third one, I would qualify it as it would be  
flagged if there wasn't sufficient time to investigate  
it, if the time lead got too short. Otherwise, perhaps  
it would be flagged if it was just peripheral to the  
line or it may be just as well be ignored if it is of  
no value at all.

Q Right. Now, the main  
problem then in selecting the first two options is  
the limitation of time between the clearing of the land  
and the ditching of the land. And you haven't got  
much time if you discover a valuable site or a  
site that you evaluate highly to persuade the company  
to change the route?

A The time is limited.

Q I beg your pardon.

A The time is limited.

Q Yes. Now, dealing with  
the problems of time, do you expect to be provided with  
a reasonable time period to first of all locate a  
valuable site if one is there and <sup>then</sup> evaluate it and then  
thirdly say persuade the company to move its route or  
do a salvage excavation?

WITNESS BOUCKHOUT: A In  
regards to time, to put the time element in perspective  
along about half of the route there would be a minimum  
of one year and along the other half there would be at  
least two years so we do have, you know, a considerable  
amount of time for reconnaissance and site identification

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

and so on.

Q In a minimum of one year  
or a maximum of one year?

A I would say a minimum  
of one year.

Q And that's over half  
of the route?

A That's over the part of  
the route planned for the first winter of construction.

Q And so for the balance  
of the route, you feel that Dr. Reeves will have -- ?

A Well, over <sup>the</sup> /portion of  
the route planned for the second winter of construc-  
tion over a good part of that route you would have the  
two years.

Q Well now, how do you  
calculate that year period?

A Well clearing will proceed  
in one winter. The clearing will be done a good portion  
at least on the line and so on will be done in one  
winter. The construction of the line would proceed  
the following winter and the construction of the latter  
part of the line to be constructed would proceed the  
winter thereafter.

Q All right. Now, Dr.  
Reeves, I want to place you in a position where you  
have discovered a site and then I take it that the job  
is evaluating the site?

WITNESS REEVES: A That is

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

correct.

Q And that I understand  
will be done by an archaeologist?

A Yes.

Q Proposition. And can  
I refer you to a report which sets out the criteria or  
suggested criteria for evaluating sites of this kind?  
Are you familiar with the preliminary archaeology study --  
archaeological study -- of the Mackenzie Corridor?

A The first or second  
report?

Q The second report by  
Dr. Cinq-mars. And could I ask you to refer to page  
28?

A Yes.

Q Well, you see at the  
bottom of the page, has this been made an exhibit?  
Perhaps we can after we have used it in this examination  
Mr. Commissioner, submit it as an exhibit. It  
might be easier for you.

At the bottom of the  
page, in paragraph 824, the author sets out certain  
attributes which he suggests be used to determine the  
individual site salvage needs. And the first is  
great lateral extent. I take it he is referring to  
the size of the site, is he not?

(PRELIMINARY ARCHAEOLOGICAL STUDY, MACKENZIE CORRIDOR/  
SECOND REPORT, MARKED EXHIBIT 313)

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

WITNESS REEVES: Yes.

Q And the second is complex horizontal and/or vertical strateography, strategraphy, and I take it that indicates the same implications. The size of the site does it not?

A That has a similar connotation and in fact it's what he refers to is probably, if I interpret it, a number of occupations, different times and uses.

Q I see, and the third is the presence of large and complex ground features.

A These are remains of structures.

Q And the fourth is indications of very great antiquity of the remains. That's self-explanatory, I take it.

A Yes.

Q And the fifth is good organic preservation. Now, the conclusion that the author comes to is that for any given site, if one finds more than one, which I take means two or more of these characteristics, that it's his view that every effort should be made to salvage the remnants.

A Or protect them.

Q I think he says total protection.

A If they have two, yes.

Q But if they have one?

A If there's one, then every

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 effort should be made to salvage it.

3 Q Yes. Now dealing with  
4 that method and that scale of rating an archaeological  
5 site, can you give your comments to us?

6 A Yes, I think I should  
7 point out that in general this is concurred with.  
8 However, in a summary statement such as this, that is  
9 more complex; in general yes, I agree with it, but  
10 it is a complicated problem. In some cases it may  
11 be a site which is characterized by two of these,  
12 which really perhaps does not deserve protection

13 Q Well --

14 A There are some other  
15 considerations also which --

16 Q -- I take it it's that  
17 kind of thought process which will go into the  
18 making of your recommendations.

19 A Yes.

20 Q And that Dr. Cing-mars  
21 criteria are the only ones that we have available. Do  
22 you have any others that you would propose using that  
23 can guides us as to what your thinking will be when  
24 the time comes?

25 A Nothing specific comes  
26 right  
27 to mind/at the moment. I'm afraid I have a very bad  
28 head cold and my thought process isn't working.

28 Q It would really be a  
29 problem of applying these general --

30 A Yes. For example

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2  
3  
4

29  
30

let me take one criteria, four indications of very great antiquity of the remains. Now we may find a site which is perhaps 100 years -- well, 200 ~~years~~ old, which on land is a very important site and should be avoided. So therefore greatest antiquity in itself is not sufficient, or necessary in combination with something else.

Q Well now, after you've applied criteria of this kind and made an evaluation of the site, you would then make a recommendation to the company.

A Yes.

Q And from your discussions with the company, do you have any idea as to whom or to what level you would make that recommendation?

A <sup>been</sup> There's/ no discussion as to the formal procedure in which it would go. I might point out this would also have to be referred to external review by interest groups and the agencies responsible for archaeological resources materials too.

Q So they would be notified immediately then?

A They would be notified and I presume they would have to evaluate the decision made by the company.

Q What external groups are you thinking of?

A I am thinking of sites in which native peoples might have some particular

Bouckhout, Drew, Claridge

1

2

interest or concern.

3

Q Yes, and then you would

4

notify outsiders quite apart altogether from your

5

client, you would notify governmental people and other

6

interest groups that may have an interest in archaeology.

7

A Archaeological sites.

8

Q I'm asking you what other

9

organizations do you have in mind?

10

A I presume the government

11

would designate some referral group specifically to

12

monitor the archaeological program which the pipeline

13

company would be carrying out. Archaeological work

14

has to be carried out under separate permit.

15

THE COMMISSIONER: Mr. Ryder,

16

how are we getting along here?

17

MR. RYDER: Well, there's some

18

very interesting things about archaeology to come,

19

Mr. Chairman, I'm afraid.

20

THE COMMISSIONER: Well, we'll

21

adjourn for a few minutes for coffee now. Before we

22

do, I think I should say that I have been advised by

23

Mr. Scott that I've been working everybody too hard

24

at this Inquiry. I don't think he was thinking of the

25

lawyers, he was thinking of the official court reporters

26

and the typists, and I know we've been working very

27

hard but we may have to continue to do so in order

28

to finish Phase 3 by Christmas, and I certainly appr-

29

ciate the work that the court reporters have done.

30

Sometimes we have been sitting from 9 in the morning

Bouckhout, Drew, Claridge  
Taylor, Reeves  
Davison, Vaartnou, Lawrence  
Cross-Exam by Ryder

1  
2 until 9:30 in the evening, so I am going to hold a  
3 reception at the Inquiry's Offices this Wednesday  
4 evening at 8 P.M. and I hope that all of you will come,  
5 the court reporters, the typists, counsel, witnesses,  
6 staff members of the Inquiry, and each participant,  
7 and the C.B.C. and the press, and I hope you will bring  
8 your wives and husbands, that is if they are nearby.

9 So we'll adjourn for coffee.

10 (PROCEEDINGS ADJOURNED FOR FEW MINUTES)

11 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

12 THE COMMISSIONER: We'll call  
13 the hearing to order again. Before you begin, Mr. Ryder,  
14 I want to make an announcement.

15 The Chamber of Commerce of the  
16 Northwest Territories asked the Inquiry to take a look  
17 at the idea of stretching out the pipeline project  
18 from three years to four years, both Arctic Gas and  
19 Foothills say that essentially the project, whichever  
20 one of them carries it out, is a 3-year project, a  
21 3-year construction project. The Chamber of Commerce  
22 has asked the Inquiry to take a look at the idea of  
23 stretching out the project from three years to four  
24 years. Now there has been evidence given that the  
25 Arctic Gas project cannot be completed in three years.  
26 Foothills says it would take four years or even five  
27 years for Arctic Gas to complete its project. Foothills  
28 says it can construct its project in three years, and  
29 as we will remember from Thursday night, Mr. Scott  
30 took some issue with that.

Bouckhout, Drew, Claridge  
Taylor, Reeves  
Davison, Vaartnou, Lawrence  
Cross-Exam by Ryder

1  
2 In any event, what the Chamber of Commerce is saying  
3 is that the Inquiry should take a look at laying it  
4 down as a condition to apply to whichever pipeline  
5 company is allowed to build the pipeline, that is that  
6 a condition should be imposed that says, "Take four  
7 years to build it, not three."

8 That is even if it turns out  
9 that they can build it in three. The Chamber of  
10 Commerce says, "Make them take four years to build it."  
11 The Chamber of Commerce says there would be some  
12 advantages to this. They are anxious naturally that  
13 northern business and northern business men should  
14 participate in the pipeline project, and for that  
15 purpose the Inquiry last year made a grant to the  
16 Chamber of Commerce to enable them to carry out an  
17 inventory of the existing capacity and potential  
18 capacity of northern business to carry out work on  
19 the pipeline project and associated development, and  
20 to supply goods and services to contractors and sub-  
21 contractors.

22 The Chamber of Commerce  
23 says that if the project were to take four years instead  
24 of three, northern business men would be able to  
25 participate in the project for an additional year.  
26 It would also mean, they say, that the project would  
27 be on a lesser scale and the extent of capital  
28 investment that northern business men would have to  
29 make to participate would be diminished. They also say  
30 that you wouldn't need 6,000 construction workers at

Bouckhout, Drew, Claridge  
 Taylor, Reeves  
 Davison, Vaartnou, Lawrence  
 Cross-Exam by Ryder

1  
 2 the peak winter season. They're referring, of course,  
 3 to the Arctic Gas project. They say that you would be  
 4 able to reduce the number of construction workers by  
 5 20% in each winter, and that you would thereby have  
 6 a greater proportion of northerners employed on the  
 7 pipeline as a percentage of the total work force. You  
 8 would also give northerners a greater opportunity of  
 9 acquiring the skills to do the jobs that require skills  
 10 on the pipeline.

11 Now, this project, we are told,  
 12 will be the greatest construction project in Canada's  
 13 history if it does go ahead. So the Chamber of Commerce  
 14 will have to be prepared to hear the pipeline companies  
 15 say that the costs are so enormous that the interest  
 16 charges on the borrowings for even one additional year  
 17 would outweigh any of the advantages to northern business  
 18 and northerners generally if the project were to be  
 19 extended one additional year.

20 They will also no doubt say  
 21 that the delivery of gas to the south would be delayed  
 22 an additional year, if the proposal of the Chamber  
 23 of Commerce were to be accepted.

24 Well, these are questions that  
 25 are important and I have advised the Chamber of Commerce  
 26 that the Inquiry is going to look into the idea they  
 27 have raised of stretching the project out from three  
 28 years to four years, and Mr. Weick, who is the chief  
 29 economist for the Inquiry staff, is heading up that  
 30 examination, the feasibility of stretching out the

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Examby Ryder

1  
2 project from three years to four years, and the  
3 examination will be carried out with the fullest  
4 consultation with the Northwest Territories Chamber  
5 of Commerce and when the study is completed, and it  
6 should be soon, the report will be brought before the  
7 Inquiry and the pipeline companies will have a chance  
8 to tackle the authors of the report.

9 Let me make it clear that  
10 in examining all of these proposals I am simply carry-  
11 ing out the task that has been laid upon the Inquiry  
12 by the Federal Government. This Inquiry is bound to  
13 consider the impact of a gas pipeline on the north in  
14 all its ramifications and to recommend the terms and  
15 conditions to be imposed if a pipeline is to be built.  
16 That doesn't mean that a pipeline is going to be built;  
17 the Government of Canada has made it plain that no  
18 decision has been made with regard to the question of  
19 whether a pipeline is going to be built. The Government  
20 of Canada has made it plain that they do not want to  
21 make a decision until they have received the report  
22 of this Inquiry. It will, of course, be for the National  
23 Energy Board to consider the question whether Canada's  
24 need for gas requires the building of a gas pipeline  
25 to bring frontier gas to markets in the south, and it  
26 will be for the Government of Canada, when they have  
27 my report before them and the National Energy Board's  
28 report to weigh Canada's need for frontier gas and  
29 the impact of the construction of a pipeline on the  
30 north and on northern peoples, and then it will be

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 for them, the Government of Canada, to decide if  
3 a pipeline should be built and if it is to be built,  
4 then where it should be built and who should build it.

5 These are political decisions  
6 to be taken by those who have been elected to make such  
7 decisions, and in the meantime we here at the Inquiry  
8 will simply carry on with our work in determining what  
9 the impact is likely to be and in devising terms and  
10 conditions to be imposed, if the pipeline goes ahead.

11 All right, Mr. Ryder.

12 MR.CARTER: Sir, could I ask  
13 a question before you proceed?

14 THE COMMISSIONER: Yes.

15 MR.CARTER: As I recall the  
16 matter of extending the construction  
17 timetable from three to four years came up at Fort  
18 Simpson, and was suggested by the Chamber of Commerce  
19 there. Do I take it that there has now been a recommen-  
20 dation from the N.W.T. Chamber as a whole that this  
21 be adopted?

22 THE COMMISSIONER: That's my  
23 advice, and the Chamber in fact was anxious to carry out  
24 this study itself and I decided that the Inquiry ought  
25 to carry out the study but giving the Chamber the  
26 fullest opportunity to work along with the Inquiry in  
27 that regard.

28 All right.

29 MR. RYDER: Thank you, sir.

30 Q Dr. Reeves, dealing with

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 your work that you propose doing between the time of  
3 clearing and the time of the coming of the ditching  
4 machine, I take it that there are really four steps  
5 that you have to go through, that have to be gone  
6 through. The first is to evaluate, the second is to  
7 advise interested governments and outside groups, and  
8 the third is to wait for the input from those interested  
9 governments and outside groups so that the company  
10 can have the benefit of their advice in selecting what  
11 is to be done with this particular site, and then you  
12 have to carry out the company's decision. We'll assume  
13 for the moment that the decision is to conduct a  
14 salvage excavation. Now, how much time is needed for all  
15 that?

16 WITNESS REEVES: This presumably  
17 would relate to all sites for excavation, or just those  
18 of particular concern?

19 Q Well, these would be the  
20 sites which you thought important enough to advise  
21 the government about your finding.

22 A Well, all I could speak  
23 to is the time required for the archaeologists to  
24 do their work. This would be dictated to some extent  
25 by the nature of the sites themselves. The site  
26 evaluation may require and certainly would require  
27 perhaps as little as one day's work, perhaps two weeks'  
28 work. The execution of a decision, presuming it  
29 was to go ahead with an excavation, would depend on  
30 the site.

Q Well can you give us an

A Requirements would vary

Q Well, are we dealing in

A It could vary from perhaps

Q And before that work can

A For those sites presumably

Q And the native groups and

A I think they would accept

Q Well, now the time avail-

A No.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 Q When will it start and when  
3 will it end?

4 A Well into freeze-up.

5 Q For a salvage excavation?  
6 Can you do that after freeze-up?

7 A Yes.

8 Q You can. So, what kind of  
9 time period will be allowed you? It is not the year  
10 because you can't work in the-- You don't begin in  
11 the depths of winter so you don't have a full year  
12 to do this. What kind of time period do you have  
13 available?

14 MR. GIBBS: Commissioner, I  
15 hesitate to interrupt but we do seem to be getting into  
16 a pretty wildly hypothetical situation. An archaeological  
17 site could be big enough for an arrowhead or the size  
18 of the Pyramids and who can tell how long it is going  
19 to take to excavate, to salvage or what? It is an  
20 interesting debate but for something that is not yet  
21 found, it doesn't seem to be leading very far.

22 MR. RYDER: Well, first of all,  
23 Mr. Commissioner, I am trying to gauge the seriousness  
24 of the applicant's proposals in this regard and its  
25 major proposals which may be impractical and may be  
26 impossible of carrying out. Now, if it is serious,  
27 then presumably it would have addressed these problems.  
28 I am not asking, for example, in my last question that  
29 Mr. Gibbs objected to, I am not asking for the time  
30 necessary to do a salvage excavation of this specific

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 site. I am asking what time does he have available to  
3 do that and see if he has considered that problem. Now,  
4 I put it to the Commission and I put it to this witness  
5 that if the applicant was serious in this evidence, they  
6 would have considered these things and they would have  
7 had ready evidence available for it.

8 MR. GIBBS: Well, sir I do  
9 take exception to this. This witness has said that he  
10 can't tell whether they are buried or whether they are  
11 archaeological sites undiscovered until the right-of-  
12 way is cleared. And in some cases he can't tell until  
13 the backhoe has bitten into it and it certainly is,  
14 I think and I submit evidence of seriousness intent, to  
15 have professional archaeologists on staff to take care  
16 of these things.

17 But you can't possibly devise  
18 careful solutions to circumstances that haven't yet  
19 occurred and may never occur. It has nothing to do  
20 with the seriousness of the proposal. It is the im-  
21 possibility of planning that far in advance.

22 MR. RYDER: Well, can I ask  
23 you this Dr. Reeves, have you considered these problems  
24 that I am putting to you before?

25 A I have had to deal with  
26 some of these problems in my work.

27 Q Have you considered them  
28 in relation--?

29 A In general planning, yes.

30 Q Well, in relation to the

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 role which you are undertaking in this project?

3 A Yes.

4 Q Then, I take it that there  
5 may, you consider it a problem that may arise after  
6 you have discovered an important site and you evaluated  
7 it as an important site, that time will be too limited  
8 to permit you to deal with it in the way you propose  
9 dealing And that is a possibility, is it not?

10 A As pointed out in the  
11 statement.

12 Q Yes, when that occurs, if  
13 you haven't enough time, the solution may be a dis-  
14 ruption of construction scheduling? That's one of the  
15 consequences of some of the solutions you may be  
16 recommending?

17 A No. The site would be  
18 flagged as I said earlier this afternoon, excavated  
19 after construction.

20 Q Even if it is a very im-  
21 portant site?

22 A In my professional opinion,  
23 I think most important sites which can be found, either  
24 before line clearing, during line clearing, will be  
25 taken care of. Those sites, which I think you are  
26 considering, are the ones which will be found by  
27 ditching.

28 Q No, no. I haven't come to  
29 ditching yet. I am dealing with important sites which  
30 are discovered in the summer available to you between

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 the clearing process and the ditching process.

3 A I think there will be  
4 sufficient time for the majority of those sites.

5 Q And now I want to deal with  
6 those sites that you haven't got time for. Now, from  
7 your discussions with the company, can you tell us, and  
8 maybe Mr. Bouckhout can tell us, whether he is prepared  
9 to consider rescheduling of his construction work?

10 WITNESS BOUCKHOUT: Well, Mr.  
11 Ryder it still remains a hypothetical situation.  
12 Rescheduling may not be necessary as we have already  
13 discussed. One of the protectional methods of getting  
14 around such a problem, if it were in fact a very  
15 important site, would be a minor rerouting around the  
16 site. It would be a matter of avoiding the site by  
17 perhaps five yards, ten yards or it could be a hundred  
18 yards. It depends on the aerial extent of the site,  
19 its importance etc.

20 Q I really just want you to  
21 advise us so we can gauge the degree of your commitment  
22 in this regard, whether you are prepared to contemplate  
23 an adjustment to your scheduling.

24 A We would certainly be  
25 prepared to contemplate it.

26 Q And are you prepared, or  
27 have you considered provisions in your contracts with  
28 your sub-contractors to enable you to adjust for the time  
29 loss and the cost incurred by these kinds of delays?

30 A Specific to this particular

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

topic, no we haven't.

Q When you flag an important site Dr. Reeves, what do you propose to protect it, it is on the right-of-way, what do you propose to do to protect it after the ditching passes by, so that any equipment and any use of the right-of-way until you can come back to it, won't disrupt the site?

WITNESS REEVES: Specifics haven't been worked out but in general flagging indicates designation on ground, instruction to company personel etc. to avoid the area.

Q Have you considered laying out a mat of timber to protect the site that way?

A In certain instances that might be desirable.

Q It is matters of that kind that you will be--?

A Yes.

Q Now, in your evidence in chief on page 47, you refer to environmental inspectors. It is in question 17 that I am referring to, that excavations will be undertaken after construction of any sites of value found during the construction phase-- No, sorry. Before that you refer to monitored by environmental inspectors.

Now, do these monitors, and I take it that these monitors will have access to an archaeologist, a professional archaeologist?

A That's correct.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 Q And the professional  
3 archaeologist, he comes to evaluate, not to monitor?

4 A In certain instances, he  
5 would be monitoring certain particularly sensitive  
6 areas.

7 Q So that when you are an-  
8 ticipating your, where you have anticipated the location  
9 of a sensitive area, you will have your professional  
10 archaeologist at hand?

11 A Yes.

12 Q He will be there in the  
13 trouble spots?

14 A Yes.

15 Q But other than that he  
16 will be at the beckoned call of your environmental  
17 monitor or your inspectors?

18 A Yes.

19 Q Now, how will this  
20 monitoring be done. In practical terms, you have the  
21 machine  
ditching, which I take it proceeds at a pace of about  
22 one mile an hour or walking speed, maybe a little  
23 faster than that, and then you have your pipe laying  
24 crew behind it. Now where in that process does the  
25 environmental monitor work? Or your archaeological  
26 monitor work when he is an environmental inspector who  
27 is doing archaeological monitoring?

28 Now, where in this process  
29 between the ditching machine in one end and the pipe  
30 laying crew at the other, where will he be working?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

A He may be working between  
the ditching and the pipelaying. He may be working  
after the pipelaying and before backfilling.

THE COMMISSIONER: How could  
we really determine that now. What advantage would  
there be? Surely even if you laid down some kind of  
guideline that he had to be at a certain location on  
the right-of-way, he would do what his common sense  
dictated as he went along, wouldn't he? Is this  
getting us anywhere, Mr. Ryder?

MR. RYDER: Well, perhaps  
not, Mr. Chairman, I don't want to press it unduly  
but it strikes me, as we are again trying to assess the  
degree of commitment to this portion of the applicant's  
evidence. Now, if, as I'm lead to believe, the proposal  
is impractical and it requires to be effective, somebody  
in the ditch with a flashlight and as the ditching /  
machine is  
proceeding then we should know that and if that's what  
they're talking about, we should know that.

THE COMMISSIONER: All right.  
Then there is two things to find out then. Whether  
Foothills is willing to commit itself to someone in  
the ditch with a flashlight -- Well, before we reach  
that question, I suppose there is the larger question  
is that something that is feasible?

MR. RYDER: Well, what is  
needed, I would have thought, to do an adequate job  
of monitoring for archaeological sites.

THE COMMISSIONER: Well, all

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1 right. Do you have any comments on that, Dr. Reeves?  
2  
3 Is it needed and if it is, is it practical? Can  
4 you get an archaeologist to spend the best part of  
5 three winters -- Well, you would need several of them  
6 in each spread. Each would have to spend a winter in  
7 that ditch with a flashlight. Is that -- Well no, but  
8 you people spend your time digging things up and  
9 underground and so forth so we're lead to believe. So  
10 maybe that isn't asking too much. What do you say to  
11 all this?

12 WITNESS REEVES: A I  
13 think in some areas it's needed. I think it can be  
14 done.

15 MR. RYDER: Q You say,  
16 you think it can be done?

17 A Yes.

18 Q And can you tell us  
19 what you mean by monitoring by these environmental  
20 inspectors? I mean would it take up --

21 A I thought you were talking  
22 about the archaeologists before?

23 Q Well, I am. I am refer-  
24 ring to the answer you've given to question 17 and  
25 you say the construction activity will be monitored  
26 by environmental inspectors who will have access to  
27 professional archaeologists. Now, I want to know what  
28 role you intend to impose on these environmental  
29 inspectors.

30 A Firstly, the environmental

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

inspectors will have some knowledge of archaeology  
and I think we have to establish that. As I pointed  
out, in certain areas, there will be archaeologists  
monitoring the ditch. What role they will have yet  
has to be worked out. To the best of my knowledge,  
this has never been done.

Q All right. So you have  
no -- when you use the term "monitor" you really have  
no content to pour into that term?

A Well, I don't think it  
would be very relevant to go into specifics of how one  
monitors the side walls of a ditch for remains of  
archaeological value.

WITNESS BOUCKHOUT: A Mr.  
Ryder, perhaps we could put the speed of this ditching  
process into perspective a bit. Certainly you may  
be right. I'm not really sure what the speed of a  
ditcher is. It may be a mile an hour but certainly the  
ditcher won't be moving continuously for a mile an  
hour or if it did so, in a couple of days, we'd have  
the entire winter's ditch open.

I don't think this is much  
of a possibility.

Q You are making fun of  
me. I don't propose that at all.

A No, I'm not, sir.

Q I'm simply saying that  
your evidence has used the term "monitored" by an  
environmental inspector. We know that these

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 environmental inspectors have many important things to  
3 do on this spread and I also have reason to believe  
4 that effective archaeological monitoring requires  
5 full time attention and I want to know how you, Dr.  
6 Reeves, can square the two competing obligations that  
7 you are imposing on these environmental inspectors?

8 MR. GIBBS: Surely, Mr.  
9 Commissioner, it is a practical matter. You have an  
10 environmentalist there. He is told to watch out for  
11 things being turned up by the ditcher. He has got  
12 access to an archaeologist. It is not a cut and dried  
13 matter which you can work out on paper sitting in an  
14 office. It's on the ground and you do the best you  
15 can with what's at hand.

16 MR. RYDER: Q And the  
17 question is, Dr. Reeves, is that practical? Is it  
18 worthwhile bothering with it at least? Can you do a  
19 good job when you spread the work so thinly?

20 WITNESS REEVES: A I think  
21 it's worthwhile.

22 Q We all agree on that. The  
23 question is can you do the job when you share the  
24 archaeological work with the biological work? Or  
25 does something valuable get lost between the stools?

26 A I don't have an answer  
27 for that. As I point out, it has never been done in  
28 North America, to my knowledge. It is something, I  
29 believe, the applicant wishes to do because he feels  
30 it is of value.

Bouckhout, Drew, Claridge,

Q So apart, I take it, from  
your archaeological, the professional archaeologist, you  
don't propose any additional staff for that period?

A Well, you used the  
singular. I didn't.

Q No, I don't mean to say  
that you were just going to have one but apart from  
your professional archaeologist, you don't propose  
any additional staff?

A At which point? For  
the monitoring?

Q Well, tell me what your  
staffing considerations are.

A Staffing considerations  
must be dictated by the requirements of the archaeolo-  
gical program. The requirements for staff, they have  
to be dictated by determining the requirements for  
each site.

Q And have you considered  
how many men you propose hiring and looking for?

A Oh yes.

Q And what conclusions  
have you come to?

A In the initial phases of  
value or reconnaissance and evaluation, of areas before  
clearing of line, during clearing, I foresee no problems  
in obtaining the required professional archaeologists  
to carry out these types of operations which I consider  
to be the most critical.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

Q And how many are you  
referring to?

A We have now made no  
man power estimates at this time.

Q Then, how can you make  
that previous statement?

A I feel that sufficient  
professional archaeologists available in Canada with  
experience in these areas that they can carry it out.

Q No matter how many you  
need?

A Well, obviously there's  
limits.

Q Perhaps, I can go on  
to Mr. Taylor, then to complete his data. Can you  
for us, Dr. Taylor, outline the terms of reference  
that your client has given you?

WITNESS TAYLOR: A The  
work is in two phases. Phase One is completed and is  
part of the submission that was made earlier this year.  
It included a reconnaissance of the corridor which  
involved evaluating a route alignment that had been  
selected. The next phase will involve more site  
specific concerns related to details of borrow pits  
and other associated facilities.

Q Now, that's your overall  
terms of reference and that describes your role and  
your obligations to your client, I take it.

A Well, very briefly.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

Q Right. Now, can you --  
at page 45, in answer to question 9, you indicate that  
recommendations are being made on an ongoing basis.

A Yes, sir.

Q Right. And can you  
outline briefly again if you will, the input that you  
made to your client to date in this project?

A The first step was to  
inventory, as I said before, the corridor as to known  
visual features of territorial significance. This  
was through reviewing various studies that had been  
done in the past two or three years.

I also did a review of  
the basic physiographic characteristics or the units  
that the pipeline would pass through to gain some  
understanding of what the characteristic landscapes  
were, to gain a better understanding of the potential  
impact.

Q Well, can I ask you to  
describe the role you have played in assisting the  
applicant with respect to some of the specific problems  
that he must confront such as the location of the  
route. Have you done any work on that problem?

A Yes. In that case, it  
was a matter of reacting to the original proposal.  
Recommendations were made as part of the team which  
included biological and geological and other inputs.  
This information then was relayed to Foothills. Occa-  
sional joint sessions were held and in many cases,

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Ryder

changes were made utilizing aesthetic inputs as one  
component.

Bouckhout, Drew, Claridge  
Davison, Vaarthou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 Q Can you, so we can just  
3 understand what you're talking about precisely, could  
4 you make any specific recommendations as a result of  
5 your assessment of the route?

6 WITNESS TAYLOR: I was concerned  
7 with location of one or two of the compressor stations  
8 initially. I think adjustments were made for that reason  
9 and other reasons.

10 Q Can you tell us where  
11 the adjustments were made? Do you know that?

12 A One case, I can't recall  
13 the exact milepost, but the location was relatively  
14 close to an area of population. The concern there was  
15 from an aesthetic point of view, was potentially  
16 visual impact but perhaps annoyance of noise came into  
17 play,

18 Q And so an adjustment  
19 was made in response to your particular --

20 A Well, there are other  
21 concerns if I recall at that particular site, including  
22 potential biological impact. So I don't recall any  
23 case where a major change was made just strictly on  
24 visual.

25 Q I take it that you played  
26 no role whatever in the original decision to select a  
27 route?

28 A Well, as I say, a  
29 preliminary corridor was submitted to our group. I  
30 reacted to it from a -- from the point of view of

aesthetics, and then some changes were subsequently made and I think reflected in the earlier submission. Other changes, for instance, in the laterals, are being reviewed now as a result of both aesthetic and land use considerations.

Q Can you give a specific example of that?

A Well, one example that was brought up last month or so, relates to Pine Point. The preliminary routing carried it through a city park, a golf course, and this wasn't evident apparently on the high level photography. An aerial reconnaissance brought it out and that proposal or that change was suggested and it's being incorporated.

Q Now, leaving that section of the applicant's proposal, your client has told us that you have been engaged for the last few months in any event, in entering on its preliminary design stage, and refining its river crossing locations and matters of that kind. Now have you played any role in this phase of the -- of your client's project?

A In preliminary design phase?

Q Yes.

A Not as yet I haven't begun. By that you mean selection of borrow pit sites, finalization of other facilities and alignments?

Q Yes.

A Yes. No, that work will

begin as the information comes to us.

Q So I take it your role in that phase will be similar to your role in the route selection phase. You will be responding to decisions made by other officers in the applicant.

A Generally, although in the initial study we identified zones of high sensitivity. That information has been available to the group for nine, close to nine months, and it's been taken into account as far as locating facilities in highly sensitive or important areas, in terms of visual quality.

Q So they did have, your client did have a list of do's and don't's with respect to some of the area decisions that have already been made.

A Yes.

Q All right, and would that include route selection? And do I get from that that your role in route selection may have been larger than at first indicated?

A Well, as I indicated earlier, a route was developed strictly on engineering criteria initially. Now this was the preliminary route and this was prior to any submission. So we reacted to that route and identified where potential problems would be. This is in contrast to say if we selected a route based solely on visual criteria, which didn't seem to be practical.

Q Now, I take it that  
you've described really the work you're doing now and  
the work you've done in the past.

A Well, I outlined very  
briefly what we will be doing on preliminary design.  
We are working on a program now for coming months to  
look at special problems, and I think borrow pits would  
be one of the more significant ones.

Q What are you telling us  
about borrow pits? What sort of things are you going  
to be considering?

A Again, when we're looking  
at potential borrow pits, we'll be concerned with their  
relationship to, first of all sensitive sites, and  
secondly areas that are close or very accessible to  
populations of people. We will be looking at some  
criterion then based on visual accessibility, if you  
wish. WE'll also be looking at possible techniques  
or appropriate forms for final shaping of the borrow  
pits.

Q And borrow reformation,  
I take it.

A That's right, but more  
from the aesthetic point of view, we're working with  
Dr. Vaartnou and I'd say some of the aesthetic  
considerations related to revegetation.

Q All right, thank you.  
Now, I take it -- and you tell me if I'm wrong -- that  
as I understand the subject matter of aesthetics, it's

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 really a question of taste, is it not?

3 A No.

4 Q The values that you have  
5 to make in recommending an adjustment because of  
6 aesthetic considerations, when you do that you're  
7 really relying upon your own particular taste to gauge  
8 those --

9 A Oh, we discussed this  
10 at some length, I think, last week. What we're trying  
11 to do is avoid that sort of subjectivity. This is why  
12 we're, first of all have inventoried known sites that  
13 have very high visual quality and have been ranked  
14 on that basis by the Federal and Territorial authorities.  
15 We have been concerned, as a principle, on facilities  
16 or features of the alignment that will be more visible  
17 than others, so our work is not that much different  
18 than say certain aspects of the biological resource  
19 study, where we have tried to identify known and  
20 identify further zones of high scenic value.

21 Q Let me come at it another  
22 way. I understood from my reading of your answers to  
23 Mr. Veale that you acknowledge that public input by  
24 people, the native groups, had its validity, as you  
25 put it, in assessing some of your recommendations or  
26 making or reaching or coming to your recommendations.

27 A Yes, I think it does.

28 Q Yes, and you then refer  
29 to some examples in the more southern provinces where  
30 programs are developed to permit input by the

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 local communities.

3 A That's right.

4 Q And isn't, in the local  
5 communities, I take it you really are imposing, you're  
6 looking therefore for some kind of indication as to the  
7 subjective views of the community.

8 A Are you speaking now  
9 more of native peoples or --

10 Q Well --

11 A -- or a cross section of the  
12 population in a given settlement such as Yellowknife?

13 Q -- I say whenever you  
14 look to the local communities to determine what  
15 their views are, whether it be in the south or whether  
16 it be with native communities in the north, you're  
17 looking for a subjective impression, their subjective  
18 impression. Is that not so?

19 A Yes, I'd say in, let's  
20 say in relationship to communities, the opinions would  
21 probably be more discernible, let's say, on a given  
22 change that might be suggested in or nearby a community.

23 Q But isn't --

24 A It would be possible  
25 to probably gain opinion on a specific proposal. It's  
26 more difficult when you're looking at a generalized  
27 proposal such as the entire route, let's say, of the  
28 pipeline, than to try to gain an impression from an  
29 individual or a group about their opinion on the total  
30 impact is rather difficult.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 But if you're looking at  
3 specific, let's say specifically a borrow pit located  
4 within Yellowknife, there may be some options there  
5 that would be more acceptable to local communities.

6 Q I can shorten this  
7 simply by saying -- you tell me if I'm wrong -- you  
8 do recognize the need for some kind of process to obtain  
9 the views of native peoples.

10 A The tradeoffs that  
11 are possible occasionally are not only visual but  
12 are related to land use, material sites and so forth,  
13 and there are choices, I think it's possible to.

14 Q But insofar as the views  
15 of the natives with respect to your particular area,  
16 you want to know what they are, you would find that  
17 useful.

18 A I think feedback is useful  
19 and it can be organized.

20 Q And the reason you want  
21 that feedback is to avoid imposing your views over  
22 views that may be quite alien to you.

23 A Well again now I think  
24 you're talking about native populations.

25 Q I'm talking about views  
26 that stem from different tastes and different cultures.

27 A There's quite a lot  
28 known about people's views. The great deficiency  
29 is in the native peoples in terms of their attitudes  
30 towards landscapes or their preferences for various

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

landscapes is their attitude towards change.

Q Right.

A That's not well-known.  
It's better known with southerners, if you want.

Q So insofar as you lack  
the views of the native organizations and native  
peoples, in your area of expertise, your program is  
somewhat deficient and lacking.

A I think the feedback  
would be useful and just as a further point I think  
from experience in the south it's most effective if  
the groups affected organized the process, though,  
themselves.

Q You don't have any  
proposal --

A No. If I was asked  
for a proposal I would suggest that we work through  
the available organizations and that they set up a  
proper sounding board so that we can communicate our  
information to them.

Q Can I ask you, Mr.  
Bouckhout, if the company has any plans to obtain the  
views of the native organizations and the native  
communities in this area?

WITNESS BOUCKHOUT: In regards  
to aesthetics specifically?

Q Well, in regard to  
aesthetics and the other areas, environmental areas  
as well.

Bouchhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 A Yes, we certainly have a  
3 community liaison program which could very easily  
4 incorporate this particular aspect in its scope of  
5 reference.

6 Q Will that be in operation  
7 in time for the input to have any influence on your  
8 decisions?

9 A Well, I hope so, it is  
10 in operation now with granted, limited success.

11 Q And I take it it's not  
12 addressing aesthetic problems?

13 A It hasn't been addressing  
14 aesthetic problems to date per se, no.

15 Q But Mr. Taylor may  
16 remedy that.

17 A He may very well do.

18 Q Is that acceptable?

19 A It certainly is acceptable  
20 if Mr. Taylor felt that this is a necessary part of  
21 his program, it certainly could be easily incorporated.

22 WITNESS TAYLOR: As I  
23 said earlier I think it could be applied to site  
24 specific projects, projects that can be illustrated  
25 can be located and relate to a community rather than  
26 to an individual, so that we can get some sort of  
27 consensus. As yet, the project isn't to that phase.  
28 I think as time goes on that again if the community  
29 groups desire this kind of information, I think it can  
30 be developed, and in cases where there are options

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 for aesthetic treatment, let's say, opinion could be  
3 gathered.

4 Q But generally speaking,  
5 I understand you, do I, that the initiative you're  
6 leaving for this input, you're leaving to the native  
7 groups themselves, to the communities themselves.

8 A Well, it has to be a joint  
9 situation, obviously. I think it would bear some  
10 pertinent thinking on the part of the consultants as to  
11 how it could be handled but I think it would be up to  
12 the individual community or affected group to decide  
13 if and when they might want to get involved.

14 Q I ask you now, Mr.  
15 Bouckhout, do you have a copy of the Pipeline Assessment  
16 Report before you? Turn to page 378 which deals  
17 with recreation areas and parks. You see that on page  
18 378 certain examples of the conflict between the  
19 proposed pipeline development on the one hand and  
20 recreational uses on the other are set out.

21 WITNESS BOUCKHOUT: Yes.

22 THE COMMISSIONER: What page  
23 is that again?

24 Q Page 378, sir; and then  
25 a recommendation is made at the bottom of page 378  
26 on the right-hand column which I've asked you to  
27 comment on. I would read it for the record:

28 "A review of all such sites and inter-actions  
29 by the applicant would provide a basis for  
30 assessing impact and identifying needs for

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 adjustments of pipeline facilities or  
3 proceures for remedial measures."

4 Now, do you agree that is  
5 a concern that requires attention?

6 A Yes, it is a concern  
7 which requires attention and we had intended in fact  
8 to cover this particular type of concern in our socio-  
9 economic panel.

10 Q So that's something we  
11 can leave to them, is it?

12 A Yes, you could leave it  
13 to them.

14 Q Do you have any views now  
15 that would be useful?

16 A Any views on what, sir?

17 Q On this recommendation?

18 A I think it's a valid  
19 recommendation, as I said.

20 Q Do you propose accepting  
21 it and undertaking it?

22 A Well, we are in fact  
23 right now carrying out reviews of this very nature,  
24 reviews of different land use types relative to our  
25 present location, including such things as parks,  
26 picnic sites, scenic areas and so on.

27 Q Do you have any work  
28 report that we could have a look at?

29 MR. GIBBS: Well, Mr. Bouckhout  
30 has already said that it was going to be dealt with

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 by the socio-economic panel. I'm sure we can leave  
3 it at that.

4 MR. RYDER: Q So do I take  
5 it that you have reports that we can look forward to?

6 A I'm not aware of any  
7 reports. As I say, there is work ongoing there. But  
8 as to what stage it is, I'm not sure since I 'm not  
9 responsible for socio-economic matters.

10 THE COMMISSIONER: Well, anything  
11 that is reduced to writing that constitutes a study or  
12 report will have to be listed and made available when  
13 it's ready, so we can rely on Foothills to do that.

14 MR. RYDER: Now, just one of  
15 two questions for Mr. Claridge, if I may.

16 Q At page 26 and 25, the  
17 bottom of page 25 and the top of page 26 you indicate  
18 that construction of river and stream crossings at  
19 the top of page 26 will generally be done during the  
20 winter when the potential effects on fish will be  
21 minimal in most cases. Now, can I ask you where  
22 you obtained that advice?

23 A That statement is actually  
24 after consulting with Mr. Bouckhout and his biological  
25 advisors, and I think it has to some extent arisen out  
26 of inter-disciplinary communication during the previous  
27 summer's program of investigating river and stream  
28 crossings. I think that as far as the pin-pointing  
29 rivers and streams and so on, that would be referred  
30 to the upcoming panel.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2  
3 Q Well, I take it, Mr.  
4 Bouckhout, is that your advice or is that the advice  
5 of your fish biologist?

6 A I think this is general  
7 advice and I think it's generally applicable. There  
8 are certain circumstances where this may not be  
9 applicable, however in those cases where a line  
10 would cross the various streams fairly close to  
11 their mouths, I think that would generally be an  
12 applicable statement.

13 Q I'm not a fish bio-  
14 logist, but listening to Dr. McCart I came to the  
15 belief that the problem with siltation is a problem  
16 which occurs in periods of low flow, which is the  
17 wintertime. Would you accept that?

18 A I would accept that  
19 on Dr. McCart's recommendation. I am not speaking  
20 as a fish biologist either.

21 Q And that the problem  
22 with siltation is not so much the degree of silta-  
23 tion which is carried in the body of the stream,  
24 it's the degree of siltation which settles on the  
25 bottom and has some impact on the eggs there, and  
26 the overwintering eggs  
27  
28  
29  
30

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Ryder

1  
2 there and the organisms.

3 A Yes, if there are over-  
4 wintering eggs there from fall spawners, I suppose  
5 again this again is really a subject which would be  
6 more relevant to the biological panel than to the  
7 geophysical panel.

8 Q Well, I can bring it  
9 up again, but just as a general observation, it  
10 appears that statement that I quoted appears to be  
11 contradicted by the previous information we received  
12 about the impacts of siltation during the wintertime.  
13 Because it's in this panel's evidence, I wanted you  
14 to comment on that apparent contradiction.  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 A Well, I am afraid I really  
3 couldn't comment any further on that. I think, as I  
4 said, that in most parts of our route we cross the  
5 streams fairly close to the mouth and in doing so I  
6 would think that the potential areas where one might  
7 find over-wintering eggs of fall spawning fish is  
8 relatively low. I think you would probably find the eggs  
9 in spawning areas likely farther upstream, above the  
10 site of the pipeline crossing.

11 Q So, it is not the time of  
12 year that you are referring to when you say during the  
13 winter, it is the location?

14 A Well, in the winter, if the  
15 streams were crossed downstream from a spawning area,  
16 where there could potentially be over-wintering eggs,  
17 I don't believe there is any particular problem with  
18 crossing downstream.

19 Certainly, if it were crossing  
20 upstream there could be a potential problem. Again, I  
21 really don't feel qualified to speak to this particular  
22 issue.

23 Q All right. Can I ask you  
24 to look at the last sentence in questions 8. "Stream  
25 diversion would be made by means of a culvert, or an  
26 excavated by-pass channel". Now, as a device for  
27 avoiding siltation, aren't there many other remedies  
28 that are more, are to be, that are to be preferred in  
29 that?

30 WITNESS CLARIDGE: For diversion

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 or are you thinking of something else, preventing  
3 siltation as such?

4 Q Well, I am getting at that  
5 a stream diversion would be made by means of a culvert  
6 of an excavated by-pass channel and I am worried about  
7 the technique of an excavated by-pass channel.

8 A This technique has been  
9 I think used in Alaska and/it has been successful in the one or  
10 two instances that I am aware of.

11 Q And I take it the purpose  
12 of the technique is to maintain downstream flow, is it?

13 A I believe that is part of  
14 the purpose and also to permit the diversion of the  
15 water out of an area that would potentially have  
16 siltation effects that were not desirable.

17 Q Now, what you want to do is  
18 you want to maintain then downstream flow with the least  
19 amount of siltation possible?

20 A Yes, in the instance in  
21 Alaska, that I am aware of, this was part of the  
22 reason. The other part that there was a potential for  
23 siltation that the biologists decided was an unaccep-  
24 table risk.

25 Q Right. Now wouldn't an  
26 excavated by-pass channel spew great quantities of  
27 muddy water into the downstream portion of the stream  
28 you are crossing?

29 A It depends what it is  
30 excavated in. In that case, I believe there was a

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 pre-existing meander bend that had gravel in it and  
3 it was simply a matter of directing it into that and  
4 protecting the entrance and exit that seemed to be  
5 satisfactory.

6 Q So, as a mitigation measure  
7 it would depend, its appropriateness would depend upon  
8 the availability of gravel or other material that  
9 wouldn't carry siltation?

10 A This is true that a method  
11 of protecting the by-pass would have to be arrived at,  
12 although I don't see that would be difficult. I think  
13 we would be talking about, generally, streams with a  
14 manageable flow and the by-pass area involved would  
15 be very small so I don't see that as being a difficult  
16 problem.

17 Q Well, now sir one last  
18 question on that. In Alaska, did you come across the  
19 mitigation technique of hoses pumping water from the  
20 upstream portion down to the downstream portion and  
21 causing the discharge to be placed on the perma frost  
22 mat some distance away from the stream so that it would  
23 filter through the mat before reaching the stream?

24 A No, sir I am not aware of  
25 that?

26 Q Well, now have you con-  
27 sidered such a technique then at all?

28 A No, I don't think that we  
29 have specifically identified the problems to the extent  
30 that we would get into methods such as that. They are

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder.

1  
2 somewhat unconventional.

3 Q So, in the meantime we  
4 are left with just one technique for crossing streams?

5 A Well as I said, until we  
6 had more specific instances. For example, we really  
7 don't have much in the way of drilling information at  
8 streams and river crossings in the beds and this would  
9 be the first type of information that we would have  
10 to gather before we were even able to design a pipeline  
11 crossing of a stream.

12 And I think to go one step  
13 further, and to try to manufacture a number of  
14 possibilities and it may be two or three steps down  
15 the road, I don't think it would mean a lot.

16 Q So, I take it that's an  
17 area that you have got under continual investigation?

18 A After we have further site  
19 information, I think the biologists would want to have  
20 more information about what they are trying to protect  
21 and the design people would have to know about the bed  
22 conditions and I am sure the hydrologists would want to  
23 know more about the hydrology of the streams before  
24 proposing more specific solutions.

25 Q So, when I suggest to you  
26 that the technique that I described of putting hoses  
27 in the upstream portion of the stream and pumping the  
28 water into the downstream portion, that method that I  
29 described, you didn't find that in Alaska?

30 A I am not aware of it.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Ryder and Goudge.

1  
2 Perhaps someone else on this panel has-- Often we  
3 relate to various contacts in Alaska and our sources  
4 of information are different. Myself, I have not heard  
5 of that technique, but perhaps someone else has here.

6 Q Can I ask you Mr.  
7 Bouckhout?

8 WITNESS BOUCKHOUT: Well, I  
9 personally wasn't aware of it either although it does  
10 sound like it has definite merit in certain circum-  
11 stances. Particularly in wintertime.

12 Q That is all I have. Mr.  
13 Goudge has some questions.

14 CROSS-EXAMINATION BY MR. GOUDGE;

15 MR. GOUDGE: Mr. Marshall has  
16 distributed Dr. Banfield's testimony sir and the lawyers  
17 are all reading it insidiously to see what was said  
18 about them and I think perhaps Mr. Marshall will be  
19 letting us know about that later on. I just have--

20 MR. MARSHALL: I will let you  
21 know when you find out what it says.

22 MR. GOUDGE : Mr. Bouckhout  
23 could I begin with you. I just have one or two questions  
24 to ask you about borrow, if I may. First you are aware--

25 MR. GIBBS: Before my friend  
26 starts on this, I was waiting <sup>until</sup> we got to this gravel  
27 and borrow pit, Mr. Davison tells me that he inadver-  
28 tently mislead in one respect to his evidence on either  
29 Thursday or Friday and would like to correct it before  
30 we start talking about gravel, if that's all right?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

MR. GOUDGE: I would be happy  
with that.

WITNESS DAVISON: Yes, it had  
to do with the Parsons Lake area and I indicated that  
we went into a borrow pit area after we had carried out  
the DIAND gravel search and I indicated that we had  
found a much greater amount of material in that borrow.

Actually, the borrow, or that  
particular source did not have high quality material  
that had been desired by the client and we were, we  
found a lesser amount of gravel, but we did find, or  
it did have general fill. But the client did not want  
general fill, they wanted high quality material.

We subsequently were able to  
find a source that had not been identified on the DIAND  
search a few miles to the west and that source turned  
out to have better quality material than we had found  
in the Parsons Lake area during DIAND. This has satis-  
fied the requirements for our client on that.

I just wanted to correct this  
one particular source, had lesser quality.

MR. GOUDGE: I take it that  
completes it Mr. Gibbs?

MR. GIBBS: Yes.

MR. BOUDGE: Mr. Bouckhout,  
let me address a couple of questions to you about  
borrow. I take it that you are aware of the pipeline  
guidelines and the concerns they raise about borrow?

WITNESS BOUCKHOUT: Yes, I am.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

1  
2 Q Yes, in particular the  
3 concern raised at page 18 and it talks about the desire  
4 expressed in the guidelines for the applicant to describe  
5 quantities and qualities of aggregate or borrow materials  
6 required and so on. And I take it your company, or  
7 Foothills is in the process of moving towards the  
8 satisfaction of those concerns?

9 A That is correct. They are  
10 proceeding with this particular aspect of the program.

11 Q Yes, in terms of the  
12 qualities of borrow that you look to need, I take it  
13 your spread sheet set out the quantities that you  
14 proposed to use by comparison with the quantities that  
15 you have found to be available in the specific area?

16 A Yes.

17 Q And when you were commenting  
18 last week as to percentages, percentages of borrow  
19 to be used as compared to borrow available, it was from  
20 those spread sheets that you were intending to take  
21 your calculations?

22  
23  
24  
25  
26  
27  
28  
29  
30

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 A It was the information  
3 gained from such sources and as I indicated at that  
4 time, the borrow material required for a replacement  
5 of ice ridge backfill and for certain slope stabilization  
6 procedures was not involved in those calculations.

7 Q Yes. Just so we will  
8 be absolutely certain. I have in front of me, a docu-  
9 ment which appears in Part Three of your application  
10 facilities, Sections D, E, F and G, construction spread  
11 1B, a pull-out sheet which has on it borrow sources and  
12 shows the available quantities that your company says  
13 are available on that spread sheet and as well the  
14 requirements that you will need on that spread sheet.

15 A That would be available  
16 quantities in <sup>the</sup> particular pits which have been designated  
17 I believe as possible pits for own purposes.

18 Q Yes. I take it, you  
19 still take the position though that if one totalled the  
20 requirements set out on those spread sheets for the  
21 entire length of the route, one could devise an easy  
22 calculation to say what percentages of borrow you  
23 say is available, you propose to use.

24 A Well, I think I indicated  
25 when we discussed this that the figures I gave were  
26 very general and it was my own fault that I used what  
27 seemed to be very specific figures.

28 Q Well, do you rely on  
29 these figures?

30 A I rely -- we relied on

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 these figures to come to the figures which I did  
3 state last week.

4  
5 Q Yes, we did a calculation  
6 that came out a little differently but if the mathe-  
7 matics are correct, you'd agree that if we start from  
8 these figures and worked through the mathematics  
9 we'll come out with the percentage of borrow you say  
10 is available that you will need?

11 A Yes, you would if you  
12 broke it down into the areas that I had done.

13 Q Well, we did it on the  
14 mainline as a whole -- totalling the sheets. That's  
15 acceptable to you too?

16 A It would be -- You'd  
17 arrive at a different figures than what I gave you  
18 exactly but you know, I'm sure if we both worked it  
19 the same way, we would come out with the same figures.

20 Q Yes. Our calculations  
21 just so you'll have them show that as a percentage of  
22 sources identified, you will need about 10% for general  
23 fill and 1% for concrete aggregate. Do those percentages  
24 ring true in your estimation without asking you to  
25 go through the mathematics?

26 A I would think they would  
27 be in the general range. Yes.

28 Q Yes. Dealing with the  
29 identification of location of borrow facilities on the  
30 alignment sheets can you tell us who it was specifically  
who made those locations?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves

29  
30

A I'm not sure specifically.

It would have been someone in the engineering department but I really couldn't tell you quite honestly specifically who did it.

Q I see. You have acknowledged, however, that there is further work on an ongoing basis concerning the extent of individual locations and the quality of borrow and so on?

A That's right. Work is planned in these areas. As I said before, it's not directly on our critical path to be done the last summer or this winter particularly but it is definitely on the path of something that has to be done obviously.

Q Yes. Can you tell us whether you have an individual or an individual department designated to do that task?

A I don't know who exactly is doing the work, quite frankly. Again it is someone in our own engineering department but I really couldn't tell you specifically who it is.

Q Would it help you if I asked who is your Gretchin Minning?

A No, I don't think it really would. I don't think we have a Gretchin Minning.

Q Is she broken down into a variety of -- ?

A I believe if you were to draw somewhat of a parallel and I don't know how valid a parallel it would be, it would be someone

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 like Milt Fawcett in our own department, in our own  
3 company rather.

4 Q Is it fair to say that  
5 the approach that Milt Fawcett and his associates will  
6 be using is close to if not identical to that we heard  
7 from CAGSL?

8 A I really couldn't say. I  
9 really don't know what approach he is going to be  
10 taking.

11 Q Is that because no  
12 approach has been decided upon?

13 A Perhaps, Mr. Claridge  
14 would comment on this. The geotechnical people are  
15 or will be involved in borrow sources.

16 WITNESS CLARIDGE: A I  
17 would butt in only as I heard Miss Minning's testimony.  
18 I thought it was excellent and I think that there would  
19 be a very similar approach to that taken by her firm  
20 and I might add one point, Klohn Leonoff/<sup>were</sup> invited to  
21 submit a proposal for carrying out borrow investigations.  
22 However, I don't believe there has been any commitment  
23 given as to the timing, simply because it hasn't been  
24 considered to be one that is crucial to the timing of  
25 the project at this point so we would anticipate some-  
26 one of Miss Minning's calibre to have an involvement  
27 and it would be done along a similar line to that  
28 which she did.

29 Q And I mean in asking that  
30 question, Mr. Claridge, the general approach to the

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

development of borrow facilities and their environmental  
implications.

A Yes, I think so.

Q Your answer goes that far?

A I'm sorry.

Q Your answer that you will  
be using a similar approach to Arctic Gas --

A It would be a similar  
approach and I think when it gets down to specifics  
that one would have to work out criteria to decide  
exactly where one draws the line. I think one example  
for instance, would be the Fort Good Hope esker that  
if it is Foothills' policy to stay out of the develop-  
ment area that I would presume that that esker would  
have to be given close thought as to whether it would  
be developed. These would be, I think, policies that  
would have to be set out in conjunction with  
Foothills.

Q One matter that occurs  
to me as being a difference in approach between Foothills  
and CAGSL arises from your application and Mr. Bouckhout  
I don't know whether to address this to you or to  
Mr. Claridge. It's at page 5D-4.6 of Volume, of Part  
Three, Sections D, E, F, and G. Would you just get that  
out, please?

WITNESS BOUCKHOUT: A 5D-5,  
is that?

Q 4.6

A I'm sorry you are going

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

to have to give me a little help here. I just can't really find that for you.

MR. GOUDGE: I will ask for a bit of help if you will bear with me for a moment. While we are locating the exact reference let me read it to you. It is a paragraph that deals with supplementary borrow material being obtained by dredging. It says:

"Supplementary borrow material will be obtained by dredging of approved and viable locations in the Mackenzie River. Borrow will be placed or stockpiled on the east bank of the river near the dredge locations. Borrow will be hauled and placed at locations remote from the river in winter when snow and winter roads can be constructed for the stockpiles. Precautions will be taken to ensure minimal environmental damage to terrain due to drainage during dredging operations."

Having brought that to your attention, let me ask you this. Are you speaking there of dredging operations apart from the digging of the trench for the line through bodies of water?

A Yes. I believe in the application they were speaking of something apart from digging the trench in the bodies of water. I might add that we have had to place constraints on that particular type of attainment of borrow material in that

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

we had said by no means could borrow be obtained by that method from either gravel bars or islands in the river and so on which are known to be of import to staging water fowl and so on.

Q This then is not simply dredging or the use, the obtaining of borrow material incidental to dredging operations which would go on for the laying of the line?

A I believe that's correct. This is one of the areas of obtaining -- the methods of obtaining material that our engineering department has been considering.

Q Yes. I take it, it is still a viable alternative as far as your engineering department is concerned.

A I believe it is still a consideration. I don't really know how viable it is as yet.

Q Do you have any information for us now as to roughly how much of your spoil or borrow you will be intending to obtain in this manner?

A No, I don't. As I say --

Q Do you have any ballpark figure. That is, are we talking a large number or a very small percentage?

A I would think it would be relatively small percentage. If I am correct, the primary use for this borrow would be at local stockpile sites very close to the river but I really couldn't say

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

more than that.

Q Have any sites been  
selected where this is your first proposal for  
your developing borrow?

A Not to my knowledge. I'm  
not sure if our engineering or our construction panel  
spoke to this particular issue but to my knowledge, no  
specific sites have been designated. As I say, this  
is a potential alternative of obtaining such material.

Q Well, have any criteria  
been developed for where this would be permissible?

A Well, I've already  
mentioned a couple beyond that it would really be a  
site-specific circumstance.

Q Just so I'll have them  
again. What were the couple?

A The couple involved are  
taking of material from gravel bars and from areas  
very close to islands which could potentially affect  
the shorelines of the islands and the gravel bars and  
so on.

Q In those areas, dredging  
would not be permitted?

A That's correct.

Q Yes. Are you prepared to  
say that you would, if necessary, advocate dredging  
anywhere else under water? Are those the only two  
constraints?

A Those are the only two

Bouckhout, Drew,Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 that come to mind immediately. There could quite  
3 possibly be others but those are the two that come  
4 to mind immediately.

5 Q Yes. Your firm has no  
6 others presently on hand?

7 A No, we don't. We have  
8 as I say, it is an alternative and we haven't looked  
9 at any specific sites per se. I am not sure what the  
10 viability or the present thinking of viability of  
11 this particular alternative is right now but since we  
12 haven't designated any sites, we have not implied or  
13 imposed any further constraints as yet until the  
14 viability of this particular type of alternative is  
15 improved.

16 Q I take it, it's your  
17 view that this is not a highly viable alternative?

18 A It has potential. I  
19 really couldn't speak to the engineering or construction  
20 viability of it. It certainly has potential that's  
21 close access to material for local stockpile sites. I  
22 couldn't say much more than that.

23

24

25

26

27

28

29

30

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 Q Has your firm or any  
3 of your consultants addressed themselves to the  
4 potential environmental impacts of this technique?

5 A Beyond the constraints  
6 I've already mentioned, we really haven't done any  
7 further on it. It's really in a preliminary stage.

8 Q Nor have you addressed  
9 yourselves, I take it, to any mitigative measures  
10 that might be taken to alleviate those impacts?

11 A That's correct.  
12 Well, I believe they have. Our Engineering Department  
13 in looking at this has mentioned such things as  
14 possibly dykes or something to control siltation if the  
15 material is in a slurry form when it's brought up or  
16 something, but you know, I'm not too up-to-date on  
17 that.

18 Q Do you know if work is  
19 going ahead to develop this as a viable alternative?

20 A I don't believe there's  
21 anything being actively pursued on it to my knowledge.

22 Q Perhaps, Mr. Gibbs,  
23 you'll advise us if work is going ahead on that as a  
24 viable alternative. Until that happens I can at the  
25 moment leave it where it is. Was that a "Yes", Mr.  
26 Commissioner, I didn't --

27 MR. GIBBS: Yes, I'm trying  
28 to find Dr. Banfield's reference to lawyers but I inten-  
29 ded to say "Yes".

30 MR. GOUDGE: Now if I can move

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 to questions arising out of your evidence. As I  
3 understood your evidence, though I must say I wasn't  
4 here to hear it in chief, but the objective of the  
5 program you devised for your client is to help restore  
6 a self-supporting ecosystem along the right-of-way.

7 WITNESS VAARTNOU: That's  
8 correct.

9 Q Now, could I ask you to  
10 recite for me what you think the environmental consequen-  
11 ces would be if there were no revegetation program?

12 A It means something would  
13 be completely unnatural. It does not fit into the  
14 environment, natural environment at all, and if we  
15 cannot establish a self-supporting ecosystem, the  
16 erosion in certain areas would be quite bad.

17 Q I suggest to you that  
18 the second point you make, the erosion problem is the  
19 primary environmental consequence that will arise if  
20 one does not revegetate.

21 A Yes it is right, but to  
22 correct that we need the self-supporting ecosystem,  
23 and that could take care of the erosion as much as we  
24 can control it through the vegetation.

25 Q Yes. The aim, though, of  
26 revegetation is to control erosion and restore  
27 surface stability.

28 A That's right, through  
29 self-supporting ecosystems.

30 Q Would you be happy if

22  
23  
24  
25  
26  
27  
28  
29  
30

erosion could be controlled and surface stability  
restored without the necessity of exactly replacing  
the native ecosystem?

A You never can replace  
native ecosystems, and impossible to do it.

Q When you refer to the  
phrase, Dr. Vaartnou, of "self-supporting ecosystem",  
and that is your aim, as I understood it, what do you  
mean by that?

A Self-supporting ecosystem,  
if we consider the nitrogen cycle, we consider the  
carbon cycle as going on in nature all the time, it  
means it has to be equilibrium established between the  
environment, plant community, and soil, micro-organisms  
and soil specifics.

Q So that for a self-  
supporting ecosystem in the boreal forest area would  
be that, a boreal forest.

A What you mean "a boreal  
forest"? Do you consider only the forest aspect?  
Do you consider the ground cover? Do you consider  
the micro-flora within the ground? What do you con-  
sider as boreal forest? I consider this all  
as a boreal forest ecosystem.

Q I'm sorry.

A Not only the trees.

Q I'm sorry, I didn't  
understand what you just said. Could you --

A I consider all those

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
CrossExam by Goudge

1  
2 factors -- soil, living part -- I mean organic living  
3 and inorganic parts of the soil, vegetation, including  
4 all, and environment.

5 Q Yes. Let me ask it  
6 this way, doctor --

7 THE COMMISSIONER: Before you  
8 go on, I was interested in your reply but I somehow  
9 lost the question. What was the previous question?

10 MR. GOUDGE: I wish I knew,  
11 sir. I was so interested in the reply I --

12 MR. GIBBS: He asked whether  
13 a boreal forest was not a self-supporting ecosystem  
14 and Dr. Vaartnou answered it.

15 MR. GOUDGE: He answered it  
16 with a question and then I think responded.

17 THE COMMISSIONER: Yes, he did.  
18 Well, the question wasn't terribly profound, now that  
19 we --

20 (LAUGHTER)

21 MR. GOUDGE: It's good to be  
22 back. I'm hunting for a better question.

23 THE COMMISSIONER: Well, just  
24 before you go, Dr. Vaartnou, the big dispute between  
25 Arctic Gas and Foothills regarding revegetation is the  
26 use which Arctic Gas urges of agronomic species and  
27 varieties for revegetation, and the insistence by  
28 Foothills upon revegetating with natural and naturalized  
29 species and varieties. Maybe "naturalized" is not  
30 the right word to use, but at least you know what I mean.

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 I got the impression, and I want you to correct me  
3 if I'm wrong, but you felt that the natural varieties  
4 had established their capacity to resist the diseases  
5 and survive in the cold; you were not at all convinced  
6 that the agronomic varieties would do so. Did I get  
7 that right or --

8 A That is correct.

9 THE COMMISSIONER: Well, I  
10 won't say anything more then.

11 MR. GOUDGE: Let me ask you  
12 this, Dr. Vaartnou, about the native species. Is it  
13 your feeling that they will generate as quickly as the  
14 agronomic species that Arctic Gas proposes to use?

15 A Native species, we have  
16 to separate some smaragd, bunch type, creeping type,  
17 and some of them are very fast established, some take  
18 two, three years like calamagrostis or Arctagrostis  
19 before they are really established. If you go to  
20 species like poa polustris, some of them  
21 native fescues, or some of the native bromes, special  
22 ecotypes, they could and will establish as fast  
23 as any introduced species, or introduced varieties,  
24 agricultural varieties.

25 Q I take it that when you  
26 assert they could and would establish themselves as  
27 quickly, you say that acknowledging that you have not  
28 yet tested their viability north of the 60th Parallel?

29 A I've seen them growing  
30 and I've seen them growing on environments simulated

Bouckhout, Drew, Claridge  
Davison, Vaartnou, Lawrence  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 to the northern environments, and in comparing the  
3 germination, how fast it germinates, and their develop-  
4 ment, I know that the ecotypes of native species could  
5 do as fast as any introduced variety. And beside that,  
6 if I'm talking naturalized landraces, these are the  
7 same species and if they are established that means  
8 that nature has helped to select them in local environ-  
9 ment conditions, why should they be slower than the  
10 introduced varieties?

11 Q Would you agree with me  
12 that if they do turn out to be slower, in generating  
13 than the introduced species, they will not serve the  
14 purpose of erosion control as well?

15 A I don't agree with that,  
16 though. Native varieties used in a northern environ-  
17 ment are much more profuse, regulative and vegetative  
18 growing heavy than most of the introduced varieties  
19 or agricultural varieties. They don't produce so  
20 much seed and in certain environment conditions they  
21 don't produce seed at all. But that doesn't mean that  
22 they are less suitable for erosion control. In my  
23 estimation they are more suitable for erosion control  
24 than varieties introduced susceptible to disease and  
25 don't survive more than half a winter, so they would  
26 go out. First winter disease is severe; but native  
27 varieties may be they don't produce so much hay, but  
28 they produce more surface cover, they produce more  
29 root system that could help more erosion control than  
30 any high hay crop can do it.

Q And you would say that even if you assumed with me that they did not grow as quickly as introduced species --

A That's correct, because they are established in the northern environment and northern environment itself usually makes the plants growing slower in certain aspects.

Q One other aspect of the program that you spoke of intrigues me, Dr. Vaartnou. Question 13 of your evidence in chief you say, as I understand you, that your program will involve aerial seeding, ground seeding using seeders, harrows, rollers and other equipment, and certain vegetative methods such as shredding and root-cuttings. I understood that correctly, did I?

A Correct, but there are other vegetation methods that we're going to use, planting, seedlings grown for that purpose, and rooted cuttings.

Q Planted seedlings and what?

A I would plant seedlings grown for that purpose. If I say it's some like native rust but we know what we can grow, grow cuttings like alder and as much as I know we can very little propagate that species with native nitrogen, collecting material that's very important for the self-supporting ecosystem in the north, it is very important that that species could be re-introduced to the slopes.

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

(MR. VAARTNOU CONT'D)

To me, this is very important. We can't do it any other way. We have to establish seedlings. We have to grow it from seeds and then plant the seedlings to the certain environmental conditions like very sandy slopes, stabilization point of view where we cannot do anything else. The other shrubs have to be handled the same way.

Q Well seedlings-- The planting of seedlings is then another way. Let me ask you, given this variety of methods that your program of re-vegetation contains. Do you propose to develop a manual for employees of the re-vegetating companies to use given this variety of techniques that they will be asked to employee?

A I expect a man who is in charge of the re-vegetation to know those techniques and would be ready to handle that approach.

Q And I take it your manual would have to include criteria as to when you used-- Sorry.

MR. GIBBS: He didn't say a manual, he said a man in charge.

Q Well a man in charge would have to be prepared to know how to choose any of these specified methods?

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

A Yes.

Q Yes. And criteria would  
have to be developed to guide that man in his choices?

A Yes, I expect the man to  
be trained before some proper agriculture school and  
then he should be specifically trained for the northern,  
application in northern areas, what is necessary.

Q And does that training  
extend to the crews of men he might have working for  
him engaged in re-vegetation?

A Yes, I expect they should  
be familiar with what they are doing.

Q Yes, and in so far as the  
supervision of those men is concerned, would you  
consider that the supervision of the crews would require  
agricultural college experience?

as  
A I don't know but/I mentioned  
that the man who is in charge of that type of thing,  
besides the knowledge and technique, he needs some kind  
of green thumb or he has to be a successful farmer.

Q You have already got one.

A If the man is in charge and  
if he wants that program to be responsible to him, what  
he wants to do there, I don't think that is enough if  
the man in charge starts to do those plans in any  
language, I've had quite a few of them, but I have not  
the plans to respond to any language but they respond  
if you love them. I learned that from my wife.

THE COMMISSIONER: Any further

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

1  
2 questions?

3 Q I just have one or two  
4 more sir. Having passed the appropriate place to end,  
5 let me just ask one or two more questions Dr. Vaartnou.  
6 You said in answer to Mr. Carter's questions last week,  
7 as I took it, that you have not yet tested the seeds  
8 you propose to use north of the sixtieth parallel?

9 A Not in that sense, yes,  
10 because if I start that program or project I do it  
11 starting first after survey, then select, then study  
12 the material in uniformity garden, then try to produce  
13 the seed, then I am ready to go back to test them in  
14 an environment where it is going to be used.

15 Q And that's the point your  
16 at now?

17 A Yes, I am at that point and  
18 I expect this winter I am advising the Foothills company  
19 the site should be selected this winter and then ready  
20 to start the research work on treeless tundra area or  
21 tundra area and some other areas to test the material.

22 Q Yes. This winter is your  
23 first crucial winter but I took it from your evidence  
24 that your test program will run over three years?

25 A Yes, I expect the preliminary  
26 report to be available after three years testing.

27 Q So, it may be three years  
28 before you can be sure that your program, using seeds,  
29 at least, will be successful?

30 A Yes, I would be sure then

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

1  
2 but I could visualize the materials collected from the  
3 actual environment should be as good as any other  
4 material.

5 Q And as, in so far as the  
6 process of shedding is concerned, as well I think you  
7 acknowledged that that process has not been tested  
8 north of the sixtieth parallel?

9 A Not, exactly. The main  
10 point there is to harvest the material. I could  
11 visualize that there would be three types of areas.  
12 One, unsaturated, then saturated, then over-saturated  
13 layers on the dirt tundra area. I could visualize that  
14 only the unsaturated layer containing on the surface  
15 growth of the shrubs, local shrubs and two to four  
16 inches of the soil can be used easily for that purpose.

17 Q And I take it, you advised  
18 your client that a testing program for shredding ought  
19 to begin this winter?

20 A That's correct.

21 Q And have you in fact designed  
22 such a testing program?

23 A Yes and no. Not final, but  
24 preliminary design is done.

25 Q Yes. Where will your tests  
26 be conducted?

27 A I don't know yet. I would  
28 like to test that in treeless tundra, then south and  
29 right close to <sup>maybe</sup> the Yellowknife area or somewhere near.

30 Q And will they be conducted

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves.  
Cross-Exam by Goudge.

1  
2 during the winter?

3 A Yes, it would be started  
4 but it would be carried out in maybe three different  
5 time zones, winter, spring and fall because I want to  
6 find out exactly when-- We are all ready doing it in the  
7 grow chambers and we started all ready last fall in  
8 Edmonton areas using native shrubs for that purpose but  
9 in the north we would like to do it in the areas that  
10 I mentioned.

11 Q I take it you would have  
12 though, to do the shredding procedure in the winter  
13 because it will be done if used on site in the winter?

14 A Yes, if it is used, if we  
15 can do the shredding directly when we pick it up, there  
16 are possibilities that we have to use special shredding  
17 machines later on in the spring. If the clumps was  
18 coming up in the winter, it was too large for proper  
19 installation or planting.  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

Q So I take it, you would,  
in fact, contemplate using shredding in the construc-  
tion process long after the winter construction season  
is over.

A Not necessarily. If the  
area is ready, we could put apply the material direct  
to that area where the pipelaying is completed and then  
we could incorporate using <sup>maybe</sup> the ditch rollers or  
corrugated rollers that do get the material incor-  
porated on the loose surface before it is -- it would  
be sealed up.

Q Now, this testing  
process you envisage for shredding, Dr. Vaartnou, again  
I think you said it will take three years before you  
can be sure of its viability?

A No, not necessarily. I  
see it first growing season if it is growing it or  
not. If I do it this winter, whenever the first growing  
season starts in the springtime, I know if the plant's  
growing or not.

Q I see, so you say for that,  
a one year time span is sufficient?

A Yes. But I would like  
to expect that we could carry on more because  
so many aspects might be economically more reasonably  
than I first could visualize.

Q I see. I take it  
though, from the mere fact, that you've proposed testing  
for both your seeding procedure and your shredding

Bouckhout, Drew, Davison  
Claridge, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

1  
2 procedure that you must contemplate the possibility  
3 now that neither seeding nor shredding will prove  
4 satisfactory?

5 A I guess say you want to  
6 con -- what I would like to do then if nothing that  
7 will grow there, --

8 Q Well, if you'll say yes  
9 to that, then I will ask you that question.

10 A I guess I replied to  
11 that one.

12 Q Pardon.

13 A I replied to the same  
14 question Friday.

15 Q Yes. And I just want to  
16 ask you whether you were serious with that reply. I  
17 wasn't here to see you but I read it.

18 A I don't think it would  
19 be economical.

20 Q You don't think it would  
21 be economical to put artificial turf or any other kind  
22 of turf up and down.

23 A No, I don't think so.

24 Q Do you have any fall-back  
25 scheme to use if seeding and shredding prove unviable?

26 A If the plant doesn't  
27 grow, then there is nothing that can be done. There  
28 must be some way a plant -- one way, or other way, we  
29 have to get the plant growing there.

30 Q No, but is it fair for

Bouckhout, Drew, Claridge,  
Davison, Vaartnou, Lawrence,  
Taylor, Reeves  
Cross-Exam by Goudge

me to say that your position is that you are confident  
seeding or shredding will work and that you have no  
other fall-back position?

A Yes, I am.

Q Thank you, sir. Those  
are all the questions I have. Oh yes. One last  
question that I was asked. Sorry. And this is really  
a proforma question. The re-vegetationscheme that you  
put forward to us here, sir. I take it you've  
recommended to your client.

A Yes.

Q And is there someone on  
the panel who can indicate whether the client has  
accepted it as a proposal for re-vegetation?

WITNESS BOUCKHOUT: A Yes,  
Dr. Vaartnou has been hired by Foothills to provide  
suggestions, recommendations, with regards to the  
re-vegetation program and we have been following his  
advice along those lines. In fact, to the point where  
as Dr. Vaartnou has already indicated, we are prepared  
to support the propogation of seed for this particular  
purpose.

Q Thank you, sir. Those  
are all the questions we have at this time.

THE COMMISSIONER: Any  
re-examination?

MR. GIBBS: No, sir.

THE COMMISSIONER: Well that  
completes the evidence of this panel then and I want

(WITNESSES ASIDE)

Oh, I should say that it completes Phase Two on behalf of the pipeline companies. We may find ourselves hearing evidence relevant to some of these topics from certain of the interveners and from ourselves later in December.

MR. MARSHALL: Mr. Commissioner, just before we break there is one matter that I would like to raise. Firstly, I would like to apologize for having Dr. Banfield's evidence distributed so late. It came about for the reason I explained last week. Namely, Dr. Banfield being away. I had indicated or in the prepared evidence for the third panel, the panel in Phase Three indicated on page 67 in parentheses that Mr. Jakimchuk will elaborate on interactions with caribou as part of a slide presentation. Mr. Jakimchuk has indeed prepared a slide presentation, sir, to deal with interactions with caribou. He has gone beyond that, sir, in that, in addition to having prepared some slides and a few brief remarks on it, he has prepared a more detailed analysis of impact potential

1 of the Arctic Gas pipeline and the Porcupine caribou  
2 herd. He has just completed work on these today and  
3 I have had copies of it made.

4 Now, sir, there are  
5 several ways it could be handled. I realize that if  
6 it were to go in as part of his direct evidence, that  
7 would violate the rule about the twenty days' notice  
8 and I think that if there would be any objection to  
9 that, I would not proceed on that basis. I would not  
10 have Mr. Jakimchuk present this as part of his direct  
11 evidence.

12 If it's intended that  
13 there be a debate dealing with these subjects, Mr.  
14 Jakimchuk would, I'm sure, intend to rely on much of  
15 the information in the paper.

16 THE COMMISSIONER: You mean  
17 the debate among the environmentalists.

18 MR. MARSHALL: Yes, of the  
19 type that you were discussing last week, sir. Or  
20 alternatively it's a matter that I'm sure he will,  
21 he could address in rebuttal evidence. Well, I am  
22 really in your hands and those of the <sup>other</sup> counsel, sir,  
23 about it. I have it prepared. It seems to me that  
24 counsel may find it of some use to in preparing their  
25 cross-examination or in their own witnesses preparing  
26 themselves to give evidence in this phase. And for  
27 that reason it might be useful to have Mr. Jakimchuk  
28 present it as part of his direct.

29 If that creates any prob-  
30 lems for any of my friends, I agree that it doesn't

1 comply with the rulings and I am prepared to not  
2 introduce the matter now.

3 THE COMMISSIONER: Well, let  
4 me tell you my feeling about this subject to what  
5 all of the other lawyers may say.

6 The question of the impact  
7 of the proposed pipeline, if it is built, on the  
8 Porcupine caribou herd, is a vital one.

26

27

28

29

30

1  
2 If Dr. Jakimchuk has prepared  
3 this study on the likely impact , I could hope that  
4 he could give it tonight as part of his direct  
5 testimony, and that counsel would have the right to  
6 call upon you to bring him back for cross-examination  
7 at a later -- on a later occasion than his appearance  
8 this week on this panel, and in that way counsel would  
9 be given an opportunity, if they didn't have enough  
10 time to prepare their cross-examination, to do so and  
11 we could bring him back later on.

12 MR. MARSHALL: I'd be prepared  
13 to undertake to recall him, sir.

14 MR. GOUDGE: On a quick canvas  
15 of head nodding, sir, I think it would be the consensus  
16 of counsel that we would be anxious to hear it. to-  
17 night, it seems to make sense to go in as part of his  
18 evidence in chief. You will remember, sir, that with  
19 this panel, as with its predecessors, we propose to  
20 segment the cross-examination. I think the large  
21 animal portion of that cross-examination may come some  
22 distance down the road, that is perhaps close to two  
23 weeks, given that we have a week's break anyway. So I  
24 think nobody will be prejudiced if the evidence is  
25 read in in chief tonight as part of Mr. Jakimchuk's  
26 presentation.

27 MR. GIBBS: I am content that  
28 should be so. Is that subject completed, sir, because  
29 I have another one I wanted to raise?

30 THE COMMISSIONER: I think it's

1 completed.

2 MR. GIBBS: I think I have  
3 an understanding with my friend, Mr. Marshall, that

4 Mr. Dau will be produced Thursday afternoon to be  
5 cross-examined on the evidence that he gave at White-  
6 horse with respect to the cost figures and so on, on  
7 the Fairbanks corridor, if that's satisfactory to you,  
8 sir, to insert him that afternoon to complete that--

9 THE COMMISSIONER: Which  
10 afternoon?

11 MR. GIBBS: Thursday afternoon,  
12 sir.

13 THE COMMISSIONER: Certainly.

14 MR. GOUDGE: While we're all  
15 reminding each other of things like that, sir, I have  
16 been asked if Mr. Marshall is in a position to give  
17 us any further information on helicopters and airplanes  
18 in connection with construction spreads. That is going  
19 to become of central relevance in Phase 3.

20 MR. MARSHALL: Yes, I must  
21 apologize, Mr. Goudge, there is a report that I believe  
22 has this information. I haven't had a chance to look  
23 at the report. From its title I would take it that  
24 it includes some of this information and we have a copy  
25 of it in the office. I confess to being derelict  
26 in getting out a revised or supplemental list of  
27 reports. I just simply haven't been able to get to  
28 it. I'm working on it, and I hadn't realized that you  
29 wanted it so quickly, but that particular report, I  
30 think, will answer the questions that you're interested

1 in and can be obtained in our office here.

2 MR. GOUDGE: Thank you, sir.

3 THE COMMISSIONER: All right,  
4 we'll adjourn until eight o'clock.

Mr. Darryl Carter for Canadian Arctic Gas  
Pipeline Limited;  
Mr. Reginald Gibbs, Q.C.,  
Mr. Alan Hollingworth &  
Mr. John W. Lutes, for Foothills Pipe Lines Ltd.;

Mr. Russell Anthony &  
Pro. Alastair Lucas for Canadian Arctic Resources  
Committee;

Mr. Glen W. Bell and  
Mr. Gerry Sutton, for Northwest Territories  
Indian Brotherhood, and  
Metis Association of the  
Northwest Territories;

Mr. John Bayly  
or  
Miss Leslie Lane for Inuit Tapirisat of Canada,  
and The Committee for  
Original Peoples Entitle-  
ment;

Mr. Ron Veale and  
Mr. Allen Lueck for The Council for the Yukon  
Indians;

Mr. Carson H. Templeton, for Environment Protection  
Board;

Mr. David Reesor for Northwest Territories  
Association of Municipal-  
ities;

Mr. Murray Sigler for Northwest Territories  
Chamber of Commerce.

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

MR. GIBBS: Mr. Commissioner,  
I have a number of requests which have been made, and  
I thought, if it was in order, I would refer to each  
one and Miss Hutchinson has a copy of all of them and  
she could perhaps mark them in order as I make reference  
to them, then we will distribute them after they have  
all been marked.

THE COMMISSIONER: Thank you.

MR. GIBBS: Firstly, sir, I  
believe this becomes Exhibit 313 -- 314, at transcript  
reference, page 8656, Mr. Marshall requested a report  
on compressor station No. 14 gas heaters.

(REPORT ON COMPRESSOR STATION NO. 14 GAS HEATERS  
MARKED EXHIBIT 314)

MR. GIBBS: Nextly, Exhibit 315,  
transcript reference, page 8676, Mr. Marshall requested  
information on the location of compressor station No. 1.

(INFORMATION ON LOCATION OF COMPRESSOR STATION 1  
MARKED EXHIBIT 315)

MR. GIBBS: Then, sir, 316,  
at transcript reference page 8696, Mr. Scott requested  
information concerning the temperature profile along  
the Yellowknife lateral.

(INFORMATION RE TEMPERATURE PROFILE ALONG  
YELLOWKNIFE LATERAL MARKED EXHIBIT 316)

MR. GIBBS: The next Exhibit  
317, transcript reference page 8760, Mr. Marshall  
requested confirmation of calculated scour depth of  
cover at the east channel crossing of the Mackenzie

1 River.

2 (SCOUR DEPTH OF COVER AT EAST CHANNEL CROSSING  
3 OF MACKENZIE RIVER MARKED EXHIBIT 317)

4 MR. GIBBS: Exhibit 318,  
5 transcript reference page 8770, Mr. Marshall requested  
6 two interim reports on the mathematical model.

7 (INTERIM REPORTS ON MATHEMATICAL MODEL MARKED  
8 EXHIBIT 318)

9 MR. GIBBS: Exhibit 319,  
10 transcript reference page 8786, Mr. Marshall requested  
11 Dr. Glockner's report made to E. Mirosh on his review  
12 of the application material on stress design.

13 (DR. GLOCKNER'S REPORT TO E. MIROSH MARKED  
14 EXHIBIT 319)

15 MR. GIBBS: Exhibit 320,  
16 transcript reference page 8818, Mr. Bayly's request for  
17 a report relating to pipelines attached to bridges.

18 (REPORT RE PIPELINES ATTACHED TO BRIDGES MARKED  
19 EXHIBIT 320)

20 MR. GIBBS: Exhibit 321,  
21 transcript reference page 8960, Mr. Scott requested  
22 a study of Foothills' communication system by C.N.  
23 Telecommunications.

24 (FOOTHILLS' COMMUNICATION SYSTEM BY C.N. TELE-  
25 COMMUNICATIONS MARKED EXHIBIT 321)

26 MR. GIBBS: Exhibit 322,  
27 transcript reference pages 9030 and 9031, Mr. Marshall  
28 requested production of the internal memorandum outlin-  
29 ing the results of detailed sound surveys at A.G.T.L.  
30 compressor stations.

(INTERIM REPORT RE SOUND SURVEYS AT A.G.T.L.  
COMPRESSOR STATIONS MARKED EXHIBIT 322)

MR. GIBBS: Exhibit 323,  
transcript reference 9061, Mr. Scott requested information on sites where helicopter transportation will be used.

(INFORMATION ON SITES WHERE HELICOPTER TRANSPORTATION WILL BE USED MARKED EXHIBIT 323)

MR. GIBBS: Exhibit 324,  
transcript reference page 9062, Mr. Scott requested information on sites where operation and maintenance would use snow roads.

(INFORMATION ON SITES WHERE O. & M. WOULD USE  
SNOW ROADS MARKED EXHIBIT 324)

MR. GIBBS: Exhibit 325,  
at transcript reference page 9063, Mr. Scott requested information on the size and type of helicopters to be used.

(INFORMATION ON SIZE & TYPE OF HELICOPTERS MARKED  
EXHIBIT 325)

MR. GIBBS: Exhibit 326,  
transcript reference pages 9101 and 9102 Mr. Scott requested that we make available the study which examines how far noise will carry from specific compressor stations.

(STUDY RE NOISE FROM COMPRESSOR STATIONS MARKED  
EXHIBIT 326)

MR. GIBBS: Exhibit 327,  
transcript reference page 9109, Mr. Scott requested that we produce the report identifying the special

1 community or wildlife concerns which would necessitate  
2 extra noise attenuation at compressor stations.

3 (REPORT IDENTIFYING COMMUNITY OR WILDLIFE CONCERNS  
4 RE NOISE AT COMPRESSOR STATIONS MARKED EXHIBIT 327)

5 MR. GIBBS: Exhibit 328,  
6 transcript reference page 9112, Mr. Scott requested  
7 that we produce when available a report on the  
8 effects of emission concentrations on wildlife and  
9 vegetation.

10 (REPORT ON EFFECTS OF EMISSION CONCENTRATIONS  
11 ON WILDLIFE & VEGETATION MARKED EXHIBIT 328)

12 MR. GIBBS: Exhibit 329,  
13 transcript reference pages 9198 and 9199, Mr. Marshall  
14 requested the information on toughness properties of  
15 A.G.T.L. 503 wall pipe.

16 (INFORMATION ON TOUGHNESS OF WALL PIPE MARKED  
17 EXHIBIT 329)

18 MR. GIBBS: Exhibit 330,  
19 transcript reference pages 9185 and 9188, and also 9223  
20 and 9224 Mr. Marshall requested data on pipe/<sup>price</sup>fluctuation.

21 PRICE  
(PIPE/FLUCTUATION DATA MARKED EXHIBIT 330)

22 MR. GIBBS: Exhibit 331,  
23 transcript reference pages 9320 and 9323, Mr. Marshall  
24 requested a report entitled:

25 "The Effects of Water Seepage on Prediction of  
26 Ground Thermal Regime dealing with the moisture  
27 migration study and its effect on the computer  
28 model."

29 (REPORT RE WATER SEEPAGE MARKED EXHIBIT 331)

30 MR. GIBBS: Exhibit 332,

1 transcript reference pages 9324 and 9326, Mr. Marshall  
2 requested two articles written by Francis Yip entitled:

3 "Prediction of Frost Formation around a chilled  
4 natural gas pipeline," and

5 "Computer simulation of the thermal regime of  
6 continuous and discontinuous permafrost."

7 (2 REPORTS BY F. YIP MARKED EXHIBIT 332)

8 MR. GIBBS: Exhibit 334, trans-  
9 cript reference, page 9347, Mr. Marshall requested  
10 information concerning geotechnical aspects of a  
11 possible cross-delta route. That's not part of this  
12 filing as it's already been responded to by Mr. Holling-  
13 worth so I am in error in saying Exhibit 334, sir.

14 Exhibit 334 is transcript  
15 reference, pages 9411 and 9414, Mr. Bayly requested a  
16 report entitled:

17 "Environmental Impact Assessment, Water,  
18 Mackenzie Gas Pipeline on stream gauging."

19 (REPORT RE ENVIRONMENTAL IMPACT ASSESSMENT WATER  
20 MACKENZIE GAS PIPELINE ON STREAM GAUGING MARKED  
21 EXHIBIT 334)

22 (COMPUTER SIMULATION OF THERMAL REGIME OF  
23 CONTINUOUS & DISCONTINUOUS PERMAFROST MARKED  
24 EXHIBIT 333)

25

26

27

28

29

31

1 MR. GIBBS: Exhibit 335,  
2 transcript reference pages 9550 and 9552. Mr. Scott  
3 requested drawings of two samples used in the design  
4 of erosion and drainage control devices.

5 (THE DESIGN OF EROSION AND DRAINAGE CONTROL  
6 DEVICES MARKED EXHIBIT 335)

7 MR. GIBBS: Exhibit 336,  
8 transcript reference pages 9562 and 9564. Mr. Marshall  
9 requested a report concerning Mr. Claridge's drainage  
10 study.

11 (REPORT CONCERNING MR. CLARIDGE'S DRAINAGE STUDY  
12 MARKED EXHIBIT 336)

13 MR. GIBBS: Exhibit 337,  
14 transcript reference pages 9575 and 9582. Mr. Scott  
15 requested the Klohn Leonoff Report on construction  
16 safeguards to counteract possible disturbance to the  
17 terrain.

18 (KLOHN LEONOFF REPORT ON CONSTRUCTION SAFEGUARDS  
19 TO COUNTERACT POSSIBLE DISTURBANCE TO THE TERRAIN  
20 MARKED EXHIBIT 337)

21 MR. GIBBS: Exhibit 338,  
22 transcript reference pages 9686 and 9687. Mr. Geneste  
23 requested estimates of cost and borrow for the con-  
24 struction of gravel roads along or on the right-of-way.

25 (ESTIMATES OF COST AND BORROW FOR THE CONSTRUCTION  
26 OF GRAVEL ROADS ALONG OR ON THE RIGHT-OF-WAY  
27 MARKED AS EXHIBIT 338)

28 MR. GIBBS: Exhibit 339,  
29 transcript reference page 9783. Mr. Bayly requested  
30 an opinion as to whether the material pulverized as a

1 consequence of blasting would be sufficiently fine to  
2 properly re-vegetate.

3 (OPINION AS TO WHETHER THE MATERIAL PULVERIZED AS  
4 A CONSEQUENCE OF BLASTING WOULD BE SUFFICIENTLY  
5 FINE TO PROPERLY RE-VEGETATE MARKED AS EXHIBIT  
6 339)

7 MR. GIBBS: Exhibit 340,  
8 transcript reference page 9932. Mr. Scott requested  
9 that we provide reports supporting the proposition  
10 that exposing the right-of-way prior to construction  
11 will not result in degradation.

12 (REPORTS SUPPORTING THE PROPOSITION THAT EXPOSING  
13 THE RIGHT-OF-WAY PRIOR TO CONSTRUCTION WILL NOT  
14 RESULT IN DEGRADATION MARKED AS EXHIBIT 340)

15 MR. GIBBS: Exhibit 341,  
16 transcript reference page 9975. Mr. Scott requested  
17 Foothills proposed methods for disposition of the  
18 pipeline test media.

19 (FOOTHILLS PROPOSED METHODS FOR DISPOSITION OF THE  
20 PIPELINE TEST MEDIA MARKED AS EXHIBIT 341)

21 MR. GIBBS: Exhibit 341--  
22 Exhibit 342, transcript reference page 10084. Mr.  
23 Scott requested the reasons why West Coast proposes  
24 ten block valves in a 140 mile section compared to each  
25 Foothills initial or proposed compressor station site.

26 (REASONS WHY WEST COAST PROPOSES TEN BLOCK VALVES  
27 IN A 140 MILE SECTION COMPARED TO EACH FOOTHILLS  
28 INITIAL OR PROPOSED COMPRESSOR STATION SITE  
29 MARKED AS EXHIBIT 342)

30 MR. GIBBS: Exhibit 343,

1 transcript reference page 10111. Mr. Scott requested  
2 estimated annual tonnages in operations and maintenance.

3 (ESTIMATED ANNUAL TONNAGES IN OPERATIONS AND MAINTENANCE  
4 MARKED AS EXHIBIT 343)

5 MR. GIBBS: Now sir there are  
6 still some outstanding responses that perhaps I could  
7 report on. I believe these are the only ones still  
8 outstanding.

9 One that I have yet to look  
10 into because I don't understand the explanation. I  
11 am told Mr. Marshall requested information on the  
12 soundings for the east channel crossing in the  
13 vicinity of Swimming Point and I was told that these  
14 couldn't be released for proprietary reasons and I have  
15 to check on what that means and I will advise you  
16 further.

17 The other requests I think  
18 are still outstanding sir, are these: Mr. Bayly  
19 requested a report on pipe coatings. That will be  
20 available later this winter. Mr. Marshall requested  
21 information on the effect of consolidation of the various  
22 soils along the Foothills route. That report will be  
23 available in December. Mr. Bayly requested information  
24 on the downstream effects of the pipeline on fish  
25 spawning and that will be dealt with by the biological  
26 panel. Mr. Bayly requested a report concerning possible  
27 changes to the composition of the material converting  
28 the pipe and stream crossings and that will be available  
29 in the beginning of 1976. Mr. Geneste requested detailed  
30 geotechnical studies which will serve as a basis for

1 preparing estimates of where Foothills will utilize  
2 blasting, concrete weights and backfill for buoyancy  
3 control and that report or study will be available on  
4 December 31. Mr. Bayly requested a procedure manual  
5 for construction workers and I am told that will not  
6 be available until the time of tender on construction  
7 contracts. Mr. Geneste requested that the report on  
8 snow roads being prepared by Mr. Jarvis, that will be  
9 available at the end of this month. Mr. Scott requested  
10 some information concerning restoration matters. That  
11 report is in preparation and I am unable to say when  
12 it will be ready sir.

13 THE COMMISSIONER: Thank you  
14 very much Mr. Gibbs.

15 MR. GIBBS: I had omitted  
16 earlier in the day to introduce Mr. Philip Kingston  
17 who is anchor man in the Foothills organization res-  
18 ponsible for producing all these responses and the  
19 prepared evidence and reading the transcripts and other  
20 of those type of duties.

21 THE COMMISSIONER: Welcome  
22 Mr. Kingston.

23 MR. MARSHALL: Thank you sir.  
24 Mr. Commissioner we are ready to present the direct  
25 evidence of the Arctic Gas panel pertaining to phase  
26 three, "Impact of the pipeline on living environment".  
27 The members of the panel are Mr. Alex Hemstock, Mr.  
28 Don Dabbs, Dr. Peter McCart, Dr. Bill Gunn, Mr. Ron  
29 Jakimchuk and Dr. Banfield. All of the panel members  
30 have previously given evidence before the inquiry with

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 the exception of Dr. Gunn. Of the other members you  
3 will recall that Mr. Jakimchuk was an overview witness  
4 and the others have appeared on various panels. I  
5 would like to review with Dr. Gunn, his qualifications.  
6 Miss Hutchinson has already sworn him sir.

7 Dr. Banfield  
8 Mr. Don Dabbs  
9 Mr. Alex Hemstock  
10 Mr. Ron Jakimchuk  
11 Dr. Peter McCart, resumed  
12 Dr. Bill Gunn, sworn

13 (DIRECT EXAMINATION BY MR. MARSHALL)

14 Q Dr. Gunn, what is your  
15 present position?

16 WITNESS GUNN: My present  
17 position is president of L.G.L. Ltd., Environmental  
18 Research Associates.

19 Q Sir, would you review your  
20 educational background.

21 A I obtained a Bachelor of  
22 Commerce from the University of Toronto in 1934 and  
23 then a P.H.D. in zoology also at the University of  
24 Toronto in 1951.

25 Q What are your professional  
26 affiliations sir?

27 A I am an elected member of  
28 the Americal Ornithologists Union. Member of the  
29 Federation of Alberta Naturalists and a Trustee of the  
30 Nature Conservancy of Canada.

Q Dr. Gunn would you review  
your professional experience?

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 A Well, after 1934 I did  
3 accounting work and public relations work until 1941.  
4 Then I enlisted in the Royal Canadian Ordnance Corps  
5 and retired from the army in 1946. From then until  
6 1950 I was at the university. From 1950 to 1952, I  
7 was a biologist with the Division of Research, Ontario  
8 Department of Lands and Forests. In 1951 I became  
9 director of Wildlife Research Station in Algonquin  
10 Provincial Park.

11 In 1952, I became the first  
12 executive director of the Federation of Ontario  
13 Naturalists, and secretary of the Conservation Council  
14 of Ontario. At the Federation of Ontario Naturalists  
15 I began producing the series of long-play records under  
16 the title of "Sounds of Nature".

17 In 1963, I began a continuing  
18 relationship with the Canadian Broadcasting Corporation  
19 in the role of biological consultant, sound recordist and  
20 a script writer, chiefly in regard to "The Nature  
21 of Things" program. I participated in CBC expeditions  
22 to the Galapagos Islands in 1965, United Kingdom in  
23 1966, East Africa in 1967 and the Canadian Arctic in  
24 1971, 1972 and 1975. I received the CBC's Wilderness  
25 Award in 1972 for contribution to the "Living Arctic",  
26 which is a one-hour special program.

27  
28  
29  
30

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield  
In Chief

Between 1964 and 1972,  
I started as representative of the Canadian Wildlife  
Service on the National Research Council's Associate  
Committee on bird Hazards to Aircraft. Part of this  
work involved intensive studies of bird migration --  
particularly geese and whistling swans -- through the  
use of radar photography and radio telemetry.

From 1970 to the present  
time, I have formed with two partners an environmental  
research firm, L.G.L. Limited. L.G.L.'s research  
projects prior to their involvement with Williams Bro-  
thers in the Arctic Gas project included a preliminary  
survey for Imperial Oil Limited in the Mackenzie Delta  
relating to distribution of waterfowl, and their nest-  
ing and migration areas.

I have been responsible  
for the planning and general supervision of the  
ornithological studies from inception to the present  
time.

Q Dr. Gunn, you have to  
your credit, the publications that are listed in  
Appendix "A" to your resume. A 2 1/2 page list of  
publication. Mr. Commissioner, in the Appendix "A", that  
was included with the direct evidence as filed, one  
of the relevant publications was omitted. We've had  
it -- we've had the resume retyped. This item is  
enclosed -- is included -- within the revised Appendix  
"A" and I will just read it into the record in case  
some of them are missing it.

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield  
In Chief

The report is entitled  
"Report on Wildlife Observations Arctic Weather  
Station, re Supply Missions, July 15 to September 7,  
1949," Dominion Wildlife Service, Department of  
Mines and Resources, 1949.

Mr. Commissioner, I  
would like to file a copy of Dr. Gunn's resume as the  
next exhibit.

(DR. GUNN'S RESUME MARKED EXHIBIT 344)

Q As well, sir, I would  
like to file as exhibits, Exhibit "B" to the panel's  
evidence which sets out the Biological Report Series.

(BIOLOGICAL REPORT SERIES, MARKED 345)  
(SUPPLEMENTAL 1975 MARKED EXHIBIT 346)

Q There is also a supple-  
ment to that list which sets out the 1975 reports. I  
would like to have that introduced as an exhibit,  
as well, sir. All of these documents I have stapled  
together and I will give the group to Miss Hutchinson.

The next is Exhibit "C",  
to the panel's evidence which sets out the current  
studies and research programs. The next is Exhibit "D"  
future studies and research programs. The next is  
Exhibit "E" to the panel's evidence, list of reports  
relied upon by the panel. Sir, all of these documents,  
Appendix "A" through "E" to the panel's evidence are  
described in Mr. Hemstock's evidence. Finally, sir, I  
would like to file as exhibits, a set of the  
Biological Report Series. I spoke to Miss Hutchinson  
about an appropriate way to have them numbered. The

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield  
In Chief

set is not yet finalized in as much as work is still going on and there will be additional volumes will be added to the set as the studies are completed and the reports are prepared.

At the moment, there are some 37 volumes and in addition there is a map folio that accompanies the volumes. We thought it might be best to give one exhibit number to the set with an identifying letter or number in parentheses after it so that additions could be made to the set as new volumes are available.

(DOCUMENTS C THROUGH E MARKED EXHIBITS 347,348,349)  
(34 VOLUMES BIOLOGICAL REPORT SERIES EXHIBIT 350)  
THE COMMISSIONER: Fine.

MR. GOUDGE: Mr. Marshall, I suppose you will be supplying us with copies of the additional volumes as they are published.

MR. MARSHALL: I had understood that they were being sent out. If the participants haven't received their copies of the most recent volumes, we do have some in our office upstairs to be made available to you. But if you do have them, if they have been sent out in the ordinary mailing to your office, we would appreciate your not getting too many extra copies, Mr. Goudge, as we only have five or six extra ones here at the moment.

All of the participants, I believe, are on the mailing list for the reports as they come out. If that's not so, well, we'll see that they are made available to the participants in the

NOV. 17/75

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield  
In Chief

1 Inquiry.

2  
3 That completes the  
4 preliminary matters and I would now ask Mr. Hemstock  
5 to begin the evidence of the panel.

6 WITNESS HEMSTOCK: A Thank  
7 you, sir. I will begin with a brief review of the work  
8 undertaken by Canadian Arctic Gas with respect to the  
9 living environment.

10 The project was first con-  
11 sidered by Northwest Project Study Group and then  
12 later Gas Arctic Systems began a study as well.

13 The Northwest Project  
14 undertook their environmental studies through the route  
15 of using recognized and highly qualified consultants.  
16 The work on vegetation was carried out by Northern  
17 Engineering Services Company Limited and R.M. Hardy  
18 & Associates under the direction of Mr. Donald Dabbs.  
19 The surveys on fisheries were carried out by Dr. Peter  
20 McCart of the University of Calgary and latterly as  
21 president of his own company, Aquatic Environments  
22 Limited. Ornithological surveys were conducted by LGL  
23 Limited under the direction of Dr. William Gunn,  
24 President. The study of mammals was done by Renewable  
25 Resources Consulting Services Limited under the immediate  
26 supervision of Mr. Ron Jakimchuk, President. Archaeo-  
27 logical reports were prepared under the overall direc-  
28 tion of Dr. J.V.M. Millar of the University of Saska-  
29 tchewan. Aesthetic considerations were discussed by Mr.  
30 S. Moorehead of Synergy West Ltd. Dr. Frank Banfield  
provided advice on several aspects of the research

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield  
In Chief

programs and kept in overall close touch with the work in the field.

The approach of the Gas Arctic Group was to leave the direction and study of the environment to an independent group known as the Environmental Protection Board. This Board is made up of eight scientists or engineers highly regarded in their respective disciplines. It was part of the policy of this group that all their studies should be made public as soon as possible and the policy has been continued after the merger with the Northwest Project Study Group and of course the monetary support of the Board has continued under Canadian Arctic Gas.

The Environmental Protection Board has published three interim reports in 1971, 1972, and 1973, and in September, 1974, issued its Environmental Impact Assessment in four volumes. The Board has presented evidence to this Hearing.

When the two groups joined in June, 1972, the various environmental studies were coordinated by those responsible in Arctic Gas. It was found that there had been remarkably little duplication and overlap, primarily due to cooperation in the field prior to merger, and the various projects were continued to completion in 1972.

In 1973 a single research program was outlined on the advice of the consultants from various disciplines and the Environmental

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1  
2 Protection Board. This work was carried out by  
3 Renewable Resources, LGL, Northern Engineering Services  
4 and Aquatic Environments. The scope of all these  
5 studies is probably best illustrated by a list of  
6 the reports available as supporting documents to the  
7 application, in general referred to as the Biological  
8 Report Series. A list of the Biological Report Series  
9 is attached as Appendix "B".

10 MR. MARSHALL: Those are now  
11 Exhibit 350 in the Inquiry.

12 The objectives of these  
13 studies were to provide the baseline information, and  
14 to investigate impacts of disturbance on wildlife so  
15 that the environmental impact of the project could be  
16 minimized. Consultation and advice to engineers and  
17 executives was provided from the start regarding the  
18 location, design, construction and operation of the  
19 pipeline.

20 The research program is  
21 continuing and the various current studies are outlined  
22 in Appendix "C". Assuming that the  
23 project goes ahead, Arctic Gas has plans for a number  
24 of programs for the future and these are listed in  
25 Appendix "D". Appendix "E" covers those reports relied  
26 upon by the panel members.

Banfield, Dabbs, Gunn,  
Hemstock, McCart, Jakinchuk  
In Chief

1                   The environmental research  
2 program has extended from Prudhoe Bay to the two  
3 delivery points on the 49th Parallel including both the  
4 interior and coastal routes in Northern Alaska and  
5 Yukon. After extensive study, the coastal route has  
6 been selected as the prime route.

7                   We believe that the studies  
8 are adequate to provide the basis for rational decisions  
9 regarding granting of a permit for the pipeline and  
10 furthermore, that the studies have provided the  
11 information necessary for compliance with the Northern  
12 Pipeline Guidelines of the Department of Indian Affairs  
13 & Northern Development and the regulations of the  
14 National Energy Board. The baseline studies have a time  
15 base of 5 years now, and this will be extended in key  
16 areas in the future. This has provided an excellent  
17 measure of the natural variations with time. Mitigation  
18 studies have been providing satisfactory results and  
19 these studies will be continued as detail design pro-  
20 ceeds on a site specific basis.

21                   The environmental program  
22 cost \$12,894,000 to the end of 1974, and expenditures  
23 this year are projected to \$3,023,000. There were  
24 four major reasons for such an extensive research pro-  
25 gram. They were:

- 26       1. To build an environmentally safe line that will  
27 perform throughout its life with a minimum impact and  
28 minimum maintenance.
- 29       2. To avoid work stoppages or delays during construc-  
30 tion and to safely maximize field working time.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 3. To establish the baseline data and the technology  
2 to ensure additions and modifications can be built  
3 with minimum cost and minimum delay and yet with the  
4 assurance of environmental safeguards. Any other new  
5 Arctic pipelines will also benefit from the basic work.

6 4. To meet the requirements of various government  
7 Acts and stipulations.

8 The monitoring of the pipeline  
9 from an engineering or operating standpoint will also  
10 provide the facility for the monitoring of the environ-  
11 mental impact along the route and in many instances,  
12 will provide additional information on the wildlife in  
13 the area. It will also provide input on some of the more  
14 destructive natural phenomena such as forest fires.  
15 The environmental studies done to date are a major con-  
16 tribution to the scientific community. The material has  
17 been made available to the government, the academic and  
18 scientific community and the public. In addition to being  
19 of scientific interest, this information will provide  
20 important data to the evaluation of other northern  
21 developments.

22 The co-ordination between  
23 environmental and engineering people has been one of  
24 the most important functions of the environmental staff  
25 of Canadian Arctic Gas, It is obvious that the questions  
26 with regard to the feasibility and the best construc-  
27 tion and operation technology for the pipeline can be  
28 answered only after consideration by the various  
29 disciplines involved. Both the environmen tal and the  
30 engineering staff in Northern Engineering have been

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 housed in the same building and there has been day to day  
2 contact between environmental and engineering people.  
3 It has been the responsibility of the Canadian Arctic  
4 Gas staff to ensure that in addition to this, there was  
5 more formalized consultation between the various environmental disciplines and also with the engineering  
6 people. Co-ordination has also been accomplished by  
7 arranging formal meetings and also by direct contact between ourselves and the two departments.

10 The organization of the environmental department in Arctic Gas includes Dr. Randall  
11 Gossen, as co-ordinator of environmental research, and  
12 Mr. Doug Rowe, as co-ordinator of the engineering  
13 and environmental interface. Mr. Ray Glasrud is environmental manager for Northern Engineering and he and his  
14 staff co-ordinate the field work of the various consultants. Mr. Glasrud reports to Dr. Jack Clark, who also  
15 heads up the Geotechnical Section in Northern Engineering. Northern Engineering employs Aquatic Environments,  
16 L.G.L., Renewable Resources and Dr. Frank Banfield to  
17 conduct the required studies for Arctic Gas.

22 In addition, an Advisory  
23 Committee of environmental officers from the various  
24 sponsor companies meets on a regular basis to provide  
25 advice to me and to my staff in environmental matters.

26 An interdisciplinary meeting  
27 was held during the week of April 9, 1973, and during  
28 this meeting virtually every mile of the pipeline was  
29 assessed under the joint criticism of engineering and  
30 environmental people. Those attending included

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 mechanical, construction and soil mechanic engineers,  
2 geologists, hydrologists, socio-economists, and  
3 representatives of the various disciplines on the  
4 environmental side. The procedure used was to consider  
5 the alignment sheets or photomosaics on a sheet by sheet  
6 basis, to determine what the environmental concerns were,  
7 what the engineering concerns were, where any conflicts  
8 might arise, and further to decide if additional work  
9 might be required. This sort of meeting was followed  
10 by a similar one in May and again as illustrated in the  
11 application (Section 8a1), the result was a change in  
12 alignment as has been discussed by Dr. Clark before  
13 this hearing.

14 Q Thank you, Mr. Hemstock.  
15 Mr. Dabbs, would you please deal with the matters  
16 related to vegetation?

17 WITNESS DABBS: The purpose  
18 of my testimony is to outline the objectives and to  
19 describe the vegetation studies conducted for Canadian  
20 Arctic Gas, which included vegetation surveys, revege-  
21 tation experimental projects and monitoring studies; and  
22 based on the research findings, to state my opinion that  
23 the pipeline right-of-way can be successfully revegetated.

24 Objectives of the vegetation  
25 program and studies included the collection of baseline  
26 data on natural plant communities and soils in order that  
27 an assessment of the probable impact of the construction  
28 and operation of the chilled gas pipeline in the northern  
29 Yukon and the Mackenzie Valley could be ascertained.  
30 A second and equally important objective was the develop-

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 ment of a program for the revegetation of all land  
2 surfaces disturbed by pipeline construction and related  
3 activities. The rationale behind this program is the  
4 restoration of a stabilizing plant cover for the pur-  
5 poses of erosion control, both for the purpose of  
6 protection of environmental quality and the protection  
7 of the pipeline itself.

8 To achieve the project goals,  
9 the study programs were established along three  
10 major lines of research. The first such area of  
11 research was the vegetation survey and classification.

12 To gain an understanding of  
13 the structure and to a degree the function of botanical  
14 components of the ecosystems traversed by the proposed  
15 pipeline, field investigations were undertaken which  
16 have produced the classification of the terrain and the  
17 associated plant communities. By reducing the complex  
18 landscape to a manageable number of ecologically meaning-  
19 ful units, the influence of various environmental  
20 factors on plant growth and productivity can be better  
21 understood. With this type of understanding, an impact  
22 assessment is possible once the details of construction  
23 and maintenance activities are known. Secondly, an  
24 understanding of soil, climate and native vegetation pro-  
25 vides the information basis on which to make decisions on  
26 restoration or revegetation actions to be taken at any  
27 location along the pipeline route.

28 The second major area of research  
29 has been revegetation trials which have been established  
30 at the test facilities at Norman Wells, Sans Sault, and

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 Prudhoe Bay, and other locations such as Inuvik and  
2 Tuktoyaktuk. This research program has evaluated  
3 the performance and the usefulness of a wide range  
4 of available grass and legume species for the purposes  
5 of land surface revegetation in northern areas. The  
6 program started in 1971 and is a continuing activity, re-  
7 examining both the established plots which have been under  
8 study for the last several years and the addition of  
9 new plots in new areas.

10 Additional research programs  
11 have been established to evaluate species performance  
12 in different habitats on new varieties that have since  
13 come to light and are considered potential candidates  
14 for revegetation. This work will continue up to and  
15 including the time of construction, as it is important  
16 to understand not only the short-term, but the long-  
17 term performance of all candidate varieties. It is also  
18 important to understand the rate and character of  
19 change which takes place as native species colonize  
20 and eventually dominate disturbed, reseeded areas.

21 A third area of research which  
22 has been under way for the past three years has been one  
23 of environmental monitoring. The objective of this  
24 program was to establish the natural conditions of  
25 drainage, soil and vegetation in a representative study  
26 area in the Mackenzie Valley prior to the construction  
27 of either a highway or a pipeline. The objective will  
28 be to return to the same site during the time of  
29 construction and for a period of time following constru-  
30 ction in order to measure and confirm environmental

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 impact predictions, and recommend mitigative actions  
2 and provide a data base for future environmental impact  
3 assessments.

4                                   Vegetation survey programs  
5 were initiated in 1972 with studies in the Northern  
6 Yukon, including both the prime and interior routes,  
7 and the mid-Mackenzie Valley. In 1973 the program was  
8 extended to north-eastern Alaska and all of the  
9 southern Mackenzie Valley down to the 60th Parallel.  
10 In 1974 the program was extended to include a case  
11 history study of existing pipelines in Western Alberta,  
12 through the Crowsnest Pass into British Columbia, and  
13 across South-western Saskatchewan. In 1975 the survey  
14 program included the cross-delta route, plus the new  
15 routing in the Fort Simpson area.

16                                   The specific objectives of  
17 these research programs were:

- 18 1. To describe the major community types and  
19 establish a framework of vegetation patterns and  
20 relationships.
- 21 2. To characterize the terrain types according to  
22 present plant cover and associated soil properties  
23 which can be important in revegetation programs.
- 24 3. To indicate some of the problem areas on the pipe-  
25 line route and make recommendations regarding terrain  
26 stability based on the vegetation study.
- 27 4. To provide information for right-of-way clearing  
28 and cost calculations based on shrub and tree cover.
- 29 5. To determine the growth characteristics of plant  
30 communities in order to predict the response of these

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 natural and man-induced disturbances.

2 6. To provide zoologists with a vegetation classifi-  
3 cation for purposes of identifying animal habitats.

4 To date, four volumes of the  
5 Biological Report series have contained the results  
6 of these survey programs. These include Volume I,  
7 Vegetation of the Northern Yukon Territory; Volume III,  
8 Part I and Part II, Vegetation and Soils of the  
9 Mackenzie Valley; and Volume XXI, Vegetation and Soils of  
10 Northeastern Alaska. Research in the areas I have men-  
11 tioned is continuing and the results will be published  
12 as they are available.

13 As manager, I was responsible  
14 for the programs and the establishment of the major  
15 objectives. I spent time in the field with each of  
16 the senior research personnel to ensure that I was  
17 satisfied with the manner in which they were conducting  
18 the studies and to familiarize myself with the area  
19 and terrain in which they were working. The responsi-  
20 bilities for the scientific approach, analysis and writ-  
21 ing of the report rested with the senior authors of  
22 each report.

23 For all of our vegetation  
24 survey studies, terrain analysis had already been done  
25 by Dr. Mollard and was plotted on photomosaic strips  
26 which are referred to as alignment sheets. These were  
27 extremely important to our studies, as they provided the  
28 means of relating vegetation types to terrain units,  
29 thus providing the basis for extrapolation from  
30 study areas to the entire pipeline route. Sampling,

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 however, went beyond the narrow confines of the  
2 right-of-way on the photomosaics because of course  
3 for a proper ecological study it was necessary to put  
4 the project into a landscape perspective.

5 I wish to point out that there  
6 is a very close relationship between plant ecology and  
7 geotechnical engineering at the level of terrain  
8 analysis. The classification and mapping of landforms  
9 is fundamental to both sciences. Consequently, there has  
10 always been a very close tie between the two groups  
11 working on this project.

12 re  
Getting into/vegetation  
13 studies, this topic was dealt with during Panel 1 of  
14 Phase 2 of the Inquiry, and the results of revegetation  
15 studies and current proposed revegetation specifications  
16 have been presented by Younkin in his report which was  
17 attached as Appendix "C" to the Phase 2 testimony.

18 The primary objective of the  
19 revegetation program is to provide an initial erosion  
20 control cover which, when combined with the physical  
21 drainage and erosion control techniques, provide the  
22 stabilization of all disturbed areas along the right-of-  
23 way and associated facilities. A second and equally  
24 important objective is to aid natural plant succession  
25 processes in the re-establishment of a permanent stable  
26 natural plant cover.

27 The research conducted at the  
28 test facilities at Prudhoe Bay, Sans Sault, Norman Wells,  
29 plus numerous additional test areas in the Inuvik,  
30 Tuktoyaktuk and delta regions, have led us to conclude

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 that revegetation of the pipeline and associated  
2 facilities is feasible. It may be necessary in many  
3 areas, particularly in tundra regions, to supplement  
4 the seeding and fertilization of the right-of-way  
5 with other techniques such as planting of shrub  
6 cuttings, use of erosion control mats, and the stripping  
7 and replacement of tundra cover to achieve the degree  
8 of revegetation required. Maintenance, by way of  
9 additional seeding and perhaps additional fertilization,  
10 may be required for several years following construction.  
11 It is anticipated, however, that this will be limited  
12 to relatively small sections.

13 The impact of pipeline con-  
14 struction on plant communities would be the removal  
15 of plant <sup>cover</sup> / over the ditch line, leaving the backfill  
16 crown devoid of a plant cover. This will be mitigated  
17 by a revegetation program which will assist in  
18 placing the disturbed pipeline crown into an early  
19 successional stage. From this stage, natural succession  
20 processes will take over and in time (depending on  
21 location and right-of-way maintenance) the native plant  
22 communities will re-establish themselves on these dis-  
23 turbed sites.

24 To achieve our goal of  
25 aiding the disturbed system to return to a stable,  
26 natural condition, we have undertaken to collect and  
27 multiply the seed of several native pioneering grasses  
28 in order that we might use this seed in our revegetation  
29 program.

30 The project was started in 1973 under the direction

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 of Dr. Younkin. Seed of Bluejoint (*Calamagrostis*  
2 *canadensis*) and Polar Grass (*Arctagrostis latifolia*)  
3 were hand collected from several locations between  
4 Fort Simpson and Tuktoyaktuk.

5 Research on this project  
6 has carried on through 1974 and 1975, both in the  
7 greenhouse and in field trials. The greenhouse re-  
8 search has been aimed at answering basic biological  
9 questions such as day length required for floral initia-  
10 tion and seed set, nutrient requirements, competitive  
11 ability, etc. Field trials for the production of  
12 seed have been established in Northern Alberta and at  
13 a site within the Mackenzie Delta proper.

14 As the selection and multi-  
15 plication of any plant species for use on a commercial  
16 or semi-commercial basis is a long and complex program,  
17 the results to date have been encouraging, though very  
18 little solid data exists to prove that it will in fact  
19 be feasible to produce these native species for pipeline  
20 revegetation. The program is continuing into 1976,  
21 thus providing an additional growing season which will  
22 assist greatly in determining the feasibility of the  
23 program.

24 Research conducted by  
25 Hernandez (1973) and the applicant, has shown that  
26 the use of agronomic varieties of grasses does not  
27 constitute a threat to native plant communities in the  
28 sense of introducing exotic species.

29 By definition, an exotic  
30 species is considered one which has come from an

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 entirely different part of the world than that to  
2 which it is being introduced, its potential for migra-  
3 tion and establishment in its new habitat being  
4 unknown. The danger posed by an exotic species is that  
5 it may have a unique genetic potential which would  
6 enable it to displace native species from their  
7 natural communities. The danger is especially great  
8 if there are no close relatives of the new species  
9 in the area of introduction.

10                   Although a number of species  
11 proposed for inclusion in the reseeding program are  
12 technically imports from Europe, all were introduced  
13 into North America 50 to 200 years ago, and all belong  
14 to genera which are a natural part of northern eco-  
15 systems. Creeping red fescue, Reed canary grass, and  
16 slender wheatgrass are species native to boreal regions  
17 of Canada. The commercial varieties are genetic  
18 strains which have been selected from existing native  
19 populations. Kentucky bluegrass, meadow foxtail, and  
20 timothy are typical species of cool temperate regions  
21 which were introduced into the Arctic by human activity  
22 as early as the 1940's. Nugget Kentucky bluegrass,  
23 for example, is a selection from a hardy strain of  
24 poa pratensis believed to have been introduced into  
25 Alaska during the gold rush. Most are now circumboreal  
26 or circumpolar in distribution, but restricted to  
27 disturbed habitats. Red top is never found in Arctic  
28 regions, but is common in Western Canada and has had su-  
29 fficient time to migrate into Arctic areas if the  
30 environment had been suitable.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

Of the major factors involved in successful plant migration, none is more important than the suitability of the environment. It is a tenet of plant geography that most plant migrations within a continent occur rapidly so that favorable environments for any given species are soon completely occupied. Resultant communities, established by the combination of many such separate plant migrations, then close to new inhabitants unless the environment changes or a species of greatly different genetic capability is introduced into the area. If the environment is suitable and extensive, the migration of the introduced species is usually rapid, as is the case of prickly-pear in Australia, which spread over thousands of acres of sheep range land in a matter of years. However, in the case of hundreds of species introduced into North America since colonial times, few have been able to displace native species from undisturbed natural communities. Almost without exception, their success was and remains in those communities disturbed in some way by man.

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 Present day construction  
2 and exploration activities in the Arctic have lead to  
3 the introduction of many species to disturbed airports  
4 and roadside sites. Few are known to have invaded un-  
5 disturbed plant communities. Studies by Hernandez  
6 (1973) in the Mackenzie Valley have shown that when seed  
7 of the proposed seed mix species have been broadcast  
8 onto the native tundra, few are able to reach even the  
9 seedling stage and appear to rapidly die out  
10 over a two-year period.

11 I therefore conclude that  
12 there will be no harmful impact on the plant communities  
13 bordering the right-of-way from the use of the commer-  
14 cially available -- commercial varieties of grasses  
15 proposed for re-vegetation.

16 Another impact of re-  
17 vegetation may be disturbance of wildlife due to seeding  
18 activities. Winter seeding (as proposed by Younkin)  
19 will reduce to a great extent the need for aircraft,  
20 either fixed-wing or helicopter for seeding -- for  
21 spring seeding which is a critical time of the year  
22 for waterfowl and mammals, particularly caribou.  
23 Helicopter seeding of areas on the North Slope would  
24 not commence before June 20 which places it a week  
25 or more after the last known date of calving of the  
26 Porcupine Caribou herd, thus eliminating any direct  
27 conflict between aircraft activity and cows at the  
28 time of calving.

29 We have been involved with  
30 the assessment of other aspects of the project on

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 vegetation. This has included the snow road trial  
2 conducted in the winter of 1973-74 at Inuvik. The  
3 test site was examined in the fall, permafrost probes  
4 and transects established, and the depth of organic  
5 cover measured for the purpose of evaluating the  
6 changes which might take place caused by the construc-  
7 tion and operation of the snow road. The snow road test  
8 site was examined during construction and re-examined  
9 in the spring as the snow melted and runoff was taking  
10 place. The same transects were re-probed and the depth  
11 of organic matter re-measured in the fall of 1974. The  
12 report on this evaluation is contained within the Inu-  
13 vik Snow Road Report prepared by Northern Engineering  
14 Services. The major conclusions of that evaluation were:

16 1. There was a large  
17 decrease in the percent of ground cover, especially  
18 by evergreen and deciduous shrubs, due to the  
19 construction and the use of the snow road.

20 2. The decrease in percent  
21 ground cover of these shrubs does not appear to be  
22 permanent, and the plants should recover to their  
23 former condition within a relatively short time.

24 3. There was no  
25 significant change in surface elevation, organic layer  
26 thickness or active layer thickness.

27 We conclude, therefore,  
28 that a processed snow road constructed in a manner simi-  
29 lar to the test road in Inuvik will protect the insula-  
30 tive organic cover and most of the ground level living

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 plants so that recovery will be quick with no signifi-  
2 cant alteration in active layer depths. Further south  
3 in the Mackenzie Valley there will be a slow degradation  
4 of permafrost to a new equilibrium level with a deeper  
5 active layer due to the removal of trees on the right-  
6 of-way. Maintaining the ground organic cover will  
7 prevent erosion and any serious environmental impact.

8 The results of our invest-  
9 igations following the second growing season confirm  
10 our predictions regarding the recovery of the shrubs  
11 on the road. We found also that there was no change in  
12 depth of thaw in the active layer across the road at  
13 several locations.

14 Plans currently call for  
15 the use of methanol as a freeze depressant for hydro-  
16 static testing of the pipeline. The Applicant has  
17 designed research programs to determine the effects of  
18 a spill on plants and the persistence of methanol in  
19 soils in the event of a pipeline failure during testing  
20 or spill during transportation or storage. In the event  
21 of such an occurrence, the methanol would eventually  
22 disappear by a combination of the processes involving  
23 volatilization, sublimation, and biodegradation.

24 Various species of soil  
25 bacteria are capable of utilizing methanol as a carbon  
26 source, for example, Pseudomonas, Achromobacter, Flavobacterium,  
27 Mycobacterium, and Xanthomonas. These  
28 species are commonly found in Arctic soils.

29 Studies are presently  
30 underway both in the laboratory and at experimental

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 test site in the north to define more precisely the  
2 mechanisms of methanol disappearance and to determine  
3 the effect of methanol on soil bacteria and fungi.

4 Studies have also been,  
5 excuse me, carried out at a test site near Inuvik to  
6 determine the effects of winter spill methanol on  
7 vegetation. The first report on this research was pre-  
8 sented by Younkin in March of 1975 entitled "The  
9 Effects of Winter Methanol Spills on Forest-Tundra  
10 Vegetation." The conclusions drawn at that time were:

11 1. Winter methanol spill  
12 rates of greater than 9 litres/m<sup>2</sup> have a damaging effect  
13 on vegetation, leading to reduction in plant cover of  
14 up to 65%.

15 2. The deleterious ef-  
16 fects of a winter methanol spill on vegetation appear  
17 to be primarily on above-ground parts. Regrowth of  
18 new leaves and shoots was apparent on some species  
19 the summer following the spill.

20 3. In the summer following  
21 the methanol application the reduction in plant cover  
22 had not resulted in a significant change in active layer  
23 thickness.

24 This research is continu-  
25 ing and further results will be presented when they  
26 are available.

27 The research to date has  
28 demonstrated the feasibility of re-vegetating the  
29 pipeline. However, this alone would not be adequate to  
30 demonstrate that Arctic Gas is prepared to undertake

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 the best possible re-vegetation program. Many of the  
2 various -- varieties, I'm sorry -- found to grow  
3 successfully in northern areas are not grown commerci-  
4 ally in large quantities. Consequently, Arctic Gas  
5 engaged the services of a seed broker to assist us in  
6 writing seed multiplication contracts with certified  
7 growers. This action was deemed necessary due to  
8 the very long lead time required to build a seed supply.  
9

10 To ensure the supply of  
11 specialized varieties, Arctic Gas has contracted for  
12 the growing of five different varieties with a total  
13 contract value in excess of one-half million dollars.  
14 These contracts are currently being revised to  
15 correspond with revised seed specifications and delayed  
16 construction schedule.

17 The re-vegetation research  
18 has demonstrated the value of two unlicensed varieties,  
19 Arctared Creeping Red Fescue and Engmo Timothy, for  
20 use in northern regions. Based on the research pre-  
21 sented to the Department, Agriculture Canada issued  
22 the release of these varieties specifically for Arctic  
23 re-vegetation on December 16, 1974.

24 It is my conclusion that  
25 we will be able to successfully re-vegetate the  
26 pipeline right-of-way (either prime or interior route-  
27 and associated facilities as required by the DINA Nor-  
28 thern Pipeline guidelines and the N.E.B. pipeline  
29 regulations. Of course, it is impossible to predict  
30 climatic variations. In any one particular season, we

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 anticipate that we may encounter problems in  
2 achieving successful re-vegetation in some areas. We  
3 will therefore have a surveillance program, in order  
4 to identify these areas at a very early stage, and take  
5 action to solve any erosion or potential erosion  
6 problems.  
7

8 MR. MARSHALL: Thank you, Mr.  
9 Dabbs.

10 THE COMMISSIONER: Maybe we  
11 could stop for five minutes and stretch our legs.

12 MR. MARSHALL: Certainly, sir.

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

MR. MARSHALL: We have just completed Mr. Dabbs evidence pertaining to vegetation and the next section of the panels evidence is that pertaining the aquatic environment and I would ask Dr. McCart to deal with that sir.

WITNESS MCCART: The purpose of my testimony is to comment on the programs and studies conducted by Aquatic Environments Limited and to comment on the likely impact on aquatic environments from the construction and operation of the proposed gas pipeline and to discuss these in light of the information which has resulted from CAGSL-sponsored studies.

Mr. Hemstock will be presenting evidence regarding mitigate measures later in this panel.

I would like to amplify some of the points raised by Mr. Hemstock concerning the impact of the pipeline on aquatic environments and fish populations in particular. In doing so, I will follow the sequence in which they will<sup>be</sup> discussed by Mr. Hemstock.

First, critical areas. The applicant has expended great effort, both in Canada and in Alaska, in identifying areas potentially critical to populations of fish. These include, spawning, rearing and overwintering areas. Information concerning such areas has been made available to this Inquiry and to

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

the public in a variety of ways:

- 1) In Chapter III of Volume 15 of the Arctic Gas Biological Report Series, "Fall spawning and overwintering areas of fish populations along routes of proposed pipeline between Prudhoe Bay and the Mackenzie Delta".
- 2) In Volumes 16, "Canada North of 60°N", 19, "Alaska", and 33, "Canada South of 60°N", of the Arctic Gas Biological Report Series. These are catalogues of lakes and streams found within various pipeline corridors which include an assessment of the importance of each stream to fish populations and the location of any known critical areas which might possibly be affected by pipeline development. The catalogues have been produced in a loose-leaf format so that any new information, from our own or other studies, can be inserted as it becomes available.
- 3) The Alignment Sheets which accompany the Application and which include comments on any known critical areas located within the area encompassed by the sheets.

I would emphasize that we do not pretend to have identified every potentially critical area within the compass of pipeline related effects. We do, however, feel that we have identified most of the major ones in Canada North of 60°N, and in Alaska. We will continue to add to our list as new information becomes available up to and including the construction phase.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

Siltation. Siltation has been properly identified as a major concern for environmentalists interested in aquatic habitats. The applicant shares this concern and has carried out a number of studies of sedimentation at various locations along the pipeline route. These include:

- 1) Volume 15, Chapter III of the Biological Report Series which describes the effect of long-term sedimentation from a seismic trail on the invertebrate fauna of a small stream near Norman Wells.
- 2) A study, still in progress, of the effects of gas pipeline crossings on the invertebrate fauna and physical conditions in several streams in south-eastern British Columbia.
- 3) Innumerable observations, scattered throughout the applicant's reports, on natural sediment loads in lakes and streams, most notably Craig, P. and P. McCart, 1975. Arctic and Alpine Reserach, Volume 7(2), pages 183-189, excuse me, 183-198.

Our assessment, based on these studies and a survey of the relevant literature, is that the short-term sedimentation which is likely to occur as the result of pipeline-related activities, will have little effect on populations of aquatic organisms unless it occurs in the vicinity of an area critical to a population, most notably, if it affects the incubating eggs of fall-spawning fishes. Of the latter, the most vulnerable is the anadromous Arctic char which, in the Western Arctic, spawns and overwinters in restricted localities in small to moderately-sized streams.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 This is the reason for the applicant's emphasis on  
3 studies of this species. Arctic fish populations are  
4 resilient, however, and even Arctic char populations  
5 are unlikely to suffer permanent damage, as long as  
6 sedimentation is short-term. Natural hydrological  
7 processes will scour the streambed and, by  
8 the next year, conditions should be as they were prior  
9 to construction.

10 Long-term sedimentation,  
11 extending over several years, could have a much greater  
12 adverse effect on populations of aquatic organisms.  
13 However, serious long-term sedimentation is an unlikely  
14 consequence of gas pipeline construction. It would  
15 affect the structural integrity of the line as well as  
16 have environmental consequences and the applicant, both  
17 in its construction techniques and its contingency plans,  
18 has taken steps to ensure that long-term erosion does  
19 not occur.

20 Oxygen Levels. Because of the  
21 long period of ice cover, oxygen concentrations in  
22 northern lakes and streams can fall to very low levels  
23 during the winter. This<sup>is</sup>/particularly true in shallow  
24 lakes and isolated pools in streams. Some reports seem  
25 to indicate that low levels are the rule in northern  
26 waterbodies. However, while northern water /certainly  
27 are vulnerable to artificially induced oxygen depression,  
28 the winter base-level oxygen concentrations in water-  
29 bodies may be higher than is generally supposed. Our  
30 studies indicate that, in the deeper lakes and where

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 water is running, oxygen levels frequently remain  
3 relatively high even under cover of ice, Biological  
4 Report Series, Volumes 16, 19 and 33. If stringent  
5 measures are taken to prevent the introduction into  
6 natural waters of materials such as domestic sewage,  
7 organic chemicals, etc., with a high biochemical  
8 oxygen demand, (B.O.D.), it is unlikely that oxygen  
9 depression resulting from pipeline related activities  
10 will be a significant factor affecting populations  
11 of aquatic organisms.

12 Water Sources. Large  
13 quantities of water will be required, especially  
14 early in the winter, for the construction of winter  
15 roads and for pipeline testing.

16 Over much of its length in  
17 Canada North of 60°N, the pipeline parallels the  
18 Mackenzie River where water is available in large  
19 quantities throughout the year. Along the Beaufort Sea  
20 coast, however, in both Canada and Alaska, water avail-  
21 ability is very much reduced during the winter. The  
22 applicant has undertaken a program to assess potential  
23 water sources along the North Slope in the Yukon  
24 Territory and Alaska. The study includes assessments  
25 of first, the quantities of water available at various  
26 times of the year and second, the potential environ-  
27 mental impact of water removal, particularly impact on  
28 fish populations and I should add that most of this  
29 material has been presented in the preceding panel and  
30 I don't propose at this point to run over an additional

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 progress report on this study, but I would be happy  
3 to answer questions during cross-examination.

4 Obstruction To Fish Passage.

5 There are two situations in which serious obstructions  
6 to fish passage could arise as a result of pipeline-  
7 related activity. These are first, at culverts and  
8 second, where berms are used at major river crossings.

9 Construction in Canada North  
10 of 60°N will require only a few short stretches of  
11 permanent road. As a result, only five culverts will  
12 be required at stream crossings, all of them south  
13 of Travaillant Lake. Of the five streams, it is  
14 likely that only three are utilized by fish. The  
15 applicant is very much aware of the problem of culverts  
16 and fish passage and has indicated, in response to  
17 question 41 of the Pipeline Assessment Group, that if  
18 culverts are used, the final design will be such as to  
19 ensure the safe upstream passage of fish.

20 Berm construction is planned  
21 for the Mackenzie River at Swimming Point and for the  
22 Great Bear River, response to question 44, Pipeline  
23 Assessment Group. The former will result in only  
24 slight increases in water velocity and is unlikely  
25 to act as an impediment to migration. At the Great  
26 Bear River, however, increases in average velocity of  
27 18% to 22% can be expected. The fisheries consultants  
28 have indicated their concern and have been advised that  
29 various methods, including culverting through the berm,  
30 modifications to the configuration of the end of the

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 berm, can be used to keep velocities within acceptable  
3 limits. Also, in the unbermed segment of the stream,  
4 the natural substrate will be retained providing fish  
5 with natural resting places behind rocks, along banks,  
6 etc.

7 Interruption of Sub-Surface  
8 Drainage. Interruption to sub-surface drainage could  
9 have a detrimental effect on fish populations if it  
10 were to affect the supply of water to spawning or  
11 overwintering areas downstream of pipeline crossings.  
12 We have been informed that this is most likely to occur  
13 where there is no free flow of water above the substrate.  
14 The sub-surface water is forced to the surface pre-  
15 maturely, forming icings and depriving downstream  
16 areas of their water supply.

17 We have examined our records to  
18 identify locations where such a situation might occur.  
19 We can find no instance in Canada North of 60°N, where  
20 a major segment of a population might be affected in  
21 this way. There are, however, several areas where small  
22 numbers of overwintering fish could be influenced.  
23 These include a spring between the Firth and Malcolm  
24 Rivers, where the pipeline passes approximately two  
25 kilometers upslope of a major spring which harbours  
26 overwintering juvenile Arctic char. Though the pipeline  
27 does not cross a stream, it could possible bisect the  
28 aquifer supplying the spring if the aquifer lies close  
29 to the surface. This could only be established by a  
30 drilling program and I have discussed this with Dr.  
Harlan.

MR. MARSHALL: That's the

WITNESS McCART: Yes, we

The other possibilities are

I would like to emphasize that

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

Borrow sites. The applicant intends to remove materials from river deposits (e.g. flood plains and terraces) wherever other sources are insufficient. To ensure that such removal does not disrupt stream habitats and populations of aquatic organisms, the applicant has defined a series of procedures for removing gravel from flood plains which ensure that any disturbance will be minimal. These procedures are presented in Appendix "A", Canadian Arctic Gas Pipelines Limited responses to Pipeline Application Assessment Group requests for supplementary information, October, 1974. Chief among them from the aquatic viewpoint are that:

1. Each site will be examined to assess the potential impact of gravel removal on populations of aquatic organisms.
2. The final boundaries of the borrow area will be designated in part on the basis of on-site inspection by an aquatic biologist;
3. Every effort will be made to reduce sedimentation including provisions that:

- (a) working areas in the active flood plain will be separated by berms, dikes, etc., so that no materials will be removed from flowing water;
- (b) the passage of construction equipment through flowing water will be restricted;
- (c) an appropriate buffer zone will be maintained between streams and gravel removal areas on fossil flood plains.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 The applicant is continuing  
2 to assess methods of gravel removal in flood plains. In  
3 September, 1974, the applicant's consultants conducted  
4 a reconnaissance of borrow sites along the Alyeska  
5 Pipeline right-of-way from Dietrich Camp to Prudhoe  
6 Bay. A report of this survey, which includes recommenda-  
7 tions for procedures to reduced environmental impact,  
8 has been made available to this Inquiry.

9 Interior route versus the  
10 prime route. From the aquatic viewpoint, the prime  
11 route --

12 THE COMMISSIONER: Excuse me,  
13 Dr. McCart. Just so there 's no misunderstanding, I  
14 take it that the prime route which you propose to  
15 discuss here is the route that skirts the Mackenzie  
16 Delta and is not the route across the mouth of the  
17 Mackenzie Delta?

18 A That's correct. That's  
19 the prime route --

20 Q The old prime route.

21 A -- prior to the cross-  
22 delta alternative.

23 MR. MARSHALL: Yes sir, there  
24 has not yet been an amendment filed, although I  
25 think there will be one

26 THE COMMISSIONER: Fine, I  
27 understand, I just want to make sure we all know what  
28 Dr. McCart is talking about.

29 A From the aquatic view-  
30 point the prime route is preferable to the interior

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 route. This preference is the result of conditions on the  
2 Alaskan portion of this route. In Alaska, the interior  
3 route follows the valley of the Marsh Fork of the  
4 Canning River. This is a narrow, steep valley with  
5 a considerable winter flow which is utilized by a  
6 large population of anadromous (sea-going) Arctic  
7 char. There are a number of objections to this routing:

8 1. Because of the narrowness of the valley there is  
9 little latitude for route adjustment and the pipeline  
10 must pass close to a number of important spawning and  
11 over-wintering areas (see Craig & McCart, 1974 ,  
12 Fall Spawning & Overwintering Areas...Arctic Gas  
13 Biological Report series, Volume 15, Chapter III).

14 2. The routing requires the construction of a  
15 permanent road, thereby increasing the requirement for  
16 borrow materials and the level of construction activity.  
17 In addition, roads are generally considered to have a  
18 greater potential for sediment production, particularly  
19 over the long-term, than are buried pipelines.

20 3. Pipeline construction would take place during the  
21 summer and early fall period. From approximately  
22 mid-August construction would conflict with the  
23 activities of spawning and overwintering Arctic char.

24 Fort Simpson Realignment.

25 As a fisheries consultant, I am in favor of the new  
26 alignment in the vicinity of Fort Simpson. The major  
27 reason for this is that the new routing eliminates one  
28 major river crossing (the Liard River), in the vicinity  
29 of a possible overwintering area for fish without  
30 endangering any areas thought to be critical to

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

populations of aquatic organisms.

Effects of methanol on fish.

The applicant has carried out studies of the toxicity of methanol to the eggs and juveniles of Arctic char and grayling (McMahon & Cartier, 1974, Methanol Toxicity and effects of methanol on development in Arctic char and grayling, interim report, Arctic Gas Biological Report series, Volume 15, Chapter V). The results, similar for the two species indicate that juveniles can tolerate concentrations as high as 1% methanol for a one-week period without any apparent effects. Of over 200 fish exposed to 1% methanol for periods of up to 168 hours, only one died.

To determine the toxicity of methanol to developing eggs, both grayling and Arctic char eggs were exposed to methanol for periods of several months, from their arrival at the laboratory until hatching. Some effects of this long-term exposure retarded development and premature hatching, were apparent at concentrations as low as 0.01% methanol.

It is apparent that methanol could cause mortality to fish if a large volume of a concentrated solution were to flush through an area in which fish or their eggs were confined. Further, even a relatively low concentration could cause mortality to eggs if the methanol were present over a long enough period.

The applicant expects that few, if any, ruptures will occur. Thus the probability that a sizeable leak will occur is small and the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakinchuk  
In Chief

1 probability that such a leak will occur in the vicinity  
2 of an area critical to populations of fish is even  
3 smaller. Nevertheless, the applicant is developing  
4 contingency plans to control flows of the test fluid,  
5 should ruptures occur. We would recommend that during  
6 tests, special attention be given to any critical  
7 areas which occur within the test section, and that  
8 cleanup equipment be stored nearby so that immediate  
9 action can be taken in the event of a spill.

10 Finally, overall impact.

11 Dr. N.J. Wilimovsky of the Environmental Protection  
12 Board has preceded me as a witness before this  
13 Inquiry. In summarizing his testimony, he concluded  
14 that:

15 "The overall effect of the construction and  
16 operation of the gas pipeline on fishes and other  
17 aquatic organisms would likely be minor."

18 He also indicated that with specific reference to fish,  
19 an oil pipeline would be 3 to 5 times and a road 6 to  
20 10 times more dangerous than a gas pipeline. I would  
21 concur with his overall assessment, emphasizing however  
22 that there is still the danger of serious disturbance to  
23 individual, local populations. In the past, we have  
24 expended much effort in studies of representative  
25 habitats and local populations and in future we intend  
26 to carry out detailed on-site studies in the vicinity  
27 of major facilities, as part of the final design phase.  
28 This will permit us to define precise mitigative mea-  
29 sures in those areas where disturbance is likely to be  
30

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 greatest. I am satisfied that our aquatic studies  
2 have met the requirements of the applicable N.E.B.  
3 regulations and that insofar as my discipline is  
4 concerned, the pipeline can be built within the  
5 requirements of the DINA Northern Pipeline Guidelines.

MR. MARSHALL:

Thank you, Dr. McCart.

7 Mr. Commissioner, I expect it would take an hour to  
8 deal with the next section of the panel's evidence.  
9 Do you wish to adjourn?

10 THE COMMISSIONER: I think we  
11 will adjourn.

12 Q Dr. McCart, I remember  
13 that evidence of Dr. Wilimovsky's and the extended  
14 guidelines for northern pipelines require that we  
15 consider not only the impact of the gas pipeline, that  
16 Arctic Gas and Foothills proposes to build, but the  
17 impact of an oil pipeline as well. Dr. Wilimovsky  
18 mentioned a highway; the highway proposal has been  
19 curtailed, as we all know, and they now say they intend  
20 only to take it as far as Wrigley, and that segment  
21 won't be completed until 1979.

22 So that the situation as  
23 regards a highway doesn't appear to have changed. There  
24 has been some clearing along the Mackenzie River north  
25 of Norman Wells. I think that is as far as the clearing  
26 has gotten. The actual construction extends north of  
27 Fort Simpson, I think, to the vicinity of River Between  
28 Two Mountains, and will carry on the very limited  
29 distance from there to Wrigley between now and 1979.  
30 So at the moment the gas pipeline, which Arctic Gas

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 and Foothills propose to build is a component of this  
2 proposed energy and transportation corridor that has  
3 to be considered.

4 The oil pipeline, the  
5 Beaufort-Delta group, have advised the Government of  
6 Canada they want to build an oil pipeline to bring  
7 crude oil from the Mackenzie Delta and the Beaufort  
8 Sea by 1983. So assuming that the gas pipeline  
9 were built, if the oil pipeline would follow, we would  
10 have two of these components in the Mackenzie Valley,  
11 and though no one has proposed as yet to build an  
12 oil pipeline across the North Slope to -- of Alaska  
13 and the Yukon, along the prime route of the gas pipe-  
14 line, that is something that might well have to be  
15 taken into consideration if the United States decided  
16 to open up petroleum reserve No. 4 on the north coast  
17 of Alaska. Then, of course, we have Mr. Horte's  
18 evidence that if the gas pipeline is built it is  
19 likely that it will be looped within five years of  
20 the commencement of construction, so that what  
21 concerns me, and you might think about this over-night  
22 and if you want to say anything about it tomorrow  
23 you certainly don't have to, What concerns me is that  
24 you have dealt in great detail with the impact of the  
25 proposed gas pipeline, you did in the last phase and  
26 you have done so again tonight.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1                                   The gas pipeline is one  
2 component of this corridor. A second gas pipeline  
3 which is what looping entails would be a second  
4 component of the corridor. And the oil pipeline would  
5 be a third component. The highway would be a fourth  
6 component except that it seems to have stalled some-  
7 where south of Wrigley for the moment.

8                                   At any rate, you might  
9 give some consideration if you wish to the impact  
10 that all of these things might over a period of years  
11 in the Mackenzie Valley and on the North Slope  
12 because the pipeline guidelines make it plain that  
13 this gas pipeline must be considered in this context  
14 of a transportation corridor, an energy and transpor-  
15 tation corridor and we cannot expect Arctic Gas and  
16 Foothills to carry out the same detailed examination  
17 in relation to proposed future developments as they  
18 have done in connection with the gas pipeline but the  
19 pipeline guidelines do require Arctic Gas to present  
20 evidence on those matters.

21                                   I have already told both  
22 pipeline companies that a number of times and they will  
23 be bringing that evidence forward but if you can give  
24 us your thoughts on that matter and this applies to  
25 all of your colleagues on the panel as we go along, I  
26 would appreciate it.

27                                   At any rate, I'm not trying  
28 to tell you, Mr. Marshall, or your -- or anybody else  
29 how to proceed but if you have any thoughts on those  
30 matters as we go along, I wish you would let me have

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

because that's what we're supposed to do, not just assume that if a gas pipeline is built, that is all that will ever happen. We're bound to look beyond that to developments that may come in its wake, And the President of Arctic Gas, Mr. Horte, has indicated that the second gas pipeline is one development that he feels likely will come within five years of the construction of the gas pipeline.

The Beaufort Delta Group, which includes the producers, Shell, Gulf, and Imperial proposes to build an oil pipe by 1983 and the Federal Government may crank up this highway again one of these days. So that's what we're looking at.

Well, we'll adjourn till 9:00 in the morning. 9:00 in the morning.

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

THE COMMISSIONER: All right,  
ladies and gentlemen, we'll come to order.

MR. MARSHALL: Mr. Commissioner,  
if you recall last night you raised a matter pertaining  
to the consideration of impacts of other facilities  
within a transportation corridor. I've discussed that  
with the members of the panel and they would like time  
to consider your remarks, sir, to look at the transcripts  
before responding. I have a feeling that they will  
be with us for a while. We'd like to get back to this  
point a little later on if we may.

THE COMMISSIONER: Fine.

MR. MARSHALL: This morning,  
sir, we have reached the ornithology section of the  
prepared evidence.

ALEXANDER WILLIAM FRANCIS  
BANFIELD,  
DONALD LAURIE DABBS  
WILLIAM W.H. GUNN  
RUSSELL ALEXANDER HEMSTOCK  
PETER J. MCCART  
RONALD DANIEL JAKIMCHUK, resumed:

DIRECT EXAMINATION BY MR. MARSHALL (CONTINUED):

Q I would ask Dr. Bill  
Gunn to present that, sir.

THE COMMISSIONER: Go ahead,  
sir.

A Thank you, sir.

The purpose of my testimony  
in this proceeding is to describe the ornithological

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1  
2 baseline studies and disturbance studies which L.G.L.  
3 undertook for Arctic Gas along the proposed routes in  
4 the State of Alaska and in Canada.

5 L.G.L. is engaged primarily  
6 in the biological aspects of environmental research.  
7 We act as consultants to governments, industry and  
8 individuals. Apart from the studies related to this  
9 hearing, some relevant projects that L.G.L. has  
10 undertaken are as follows:

- 11 1. Studies of distribution and numbers of birds and  
12 marine mammals and fish in the eastern and central  
13 Arctic, for the Polar Gas project.
- 14 2. A study of possible competition between muskoxen and  
15 caribou for food on Banks Island, for the Government of  
16 the Northwest Territories.
- 17 3. An appraisal of possible effect of highway con-  
18 struction in the Mackenzie River Valley on wetlands  
19 and wildlife for the Government of Canada.
- 20 4. Ornithological, hydrological and remote sensing  
21 studies in the Athabasca Tar Sands region, for Syncrude  
22 Canada Ltd.
- 23 5. A literature review of the effects of fire on the  
24 boreal forest for the Departmen t of Indian Affairs &  
25 Northern Development of the Government of Canada.
- 26 6. An analysis of bird distribution in and near the  
27 Beaufort Sea for the Canadian Wildlife Service.
- 28 7. Several studies of environm ental problems at  
29 airports in Canada and elsewhere, mainly for the  
30 Canadian Ministry of Transport and the National Research

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

Council of Canada.

8. Studies of bird mortality at tall structures such as chimney stacks, television towers, etc. for several clients.

9. A radar and visual study of coastal sea birds on the Beaufort Sea.

L.G.L.'s first association with Arctic Gas was when our firm was first retained by Williams Brothers (Canada) Ltd. early in 1971. At that time, Williams Brothers was undertaking a feasibility study for a gas pipeline that would run generally from Prudhoe Bay through Western Canada and into the lower 48 states of the United States. Our assignment was:

1. To determine whether or not birds would be disturbed by either construction or operation activities of a pipeline through this area;

2. Whether the extent of such disturbance might be so great as to warrant consideration of a major change in the form of the project being considered; and

3. If not, what the extent of disturbance might be, and how it might be mitigated.

In order to prepare for our ornithological studies, we examined the ornithological literature and found very little about bird populations and distribution along the proposed routes, particularly along the North Slope in the area between Prudhoe Bay in Alaska and the Mackenzie River Delta in Canada.

We therefore considered that

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1  
2 our first task was to undertake what we term "baseline"  
3 studies in order to gain a knowledge of bird populations  
4 and distribution, the locations of concentration areas,  
5 the times of year in which birds occupy these areas,  
6 and aspects of their life cycle occurring in these  
7 periods, e.g. breeding, raising young, moulting, pre-  
8 paring for migration, migration, and wintering.

9 We also undertook research  
10 involving disturbance experiments that we devised to  
11 simulate the types of disturbance that would probably  
12 be associated with the construction and operation of a  
13 gas pipeline. Along the North Slope, our work geo-  
14 graphically encompassed the proposed route from Prudhoe  
15 Bay across north-eastern Alaska and across north-western  
16 Yukon to the Mackenzie River Delta. We also reviewed  
17 the route through the Brooks Mountain Range and across  
18 the Richardson Mountains to the Mackenzie River. We  
19 also examined the proposed routes up the Mackenzie  
20 River Valley and south through the Western Provinces  
21 of Canada to the lower 48 of the United States.

22 The studies which were con-  
23 ducted and the reports which resulted from the studies  
24 were done under my overall supervision and direction.

25 We began our field studies  
26 in 1971 and have continued them in '72, '73, '74 and '75,  
27 to the present time. We anticipate that studies will  
28 be continued in 1976 and beyond.

29 In order to summarize the  
30 objectives and results of these studies as succinctly

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1  
2 as possible, I would first like to present the baseline  
3 studies by geographic region and then similarly describe  
4 the disturbance studies.

1  
2 I will deal first with the  
3 region, hereinafter referred to as the Northern Region,  
4 traversed by the proposed coastal route and the interior  
5 alternative route in northeastern Alaska and the  
6 northern Yukon. Then I will review the studies under-  
7 taken in the region extending south from the Mackenzie  
8 River Delta along the proposed route to the 60th  
9 parallel north, hereinafter referred to as the  
10 Mackenzie Region.

11 In 1971, LGL conducted aerial  
12 surveys of two types in the northern region. Aerial  
13 surveys of a general, exploratory nature, were flown to  
14 obtain information about bird distributions and to  
15 select areas for future ground study. Grid-type aerial  
16 transects were also flown along predetermined routes  
17 on the North Slope and the Old Crow Flats in the  
18 northern Yukon in order to obtain sample counts of  
19 waterfowl and other water birds in these areas. We  
20 confirmed that these were important areas for waterfowl.  
21 The results are reported in Volume 10 of the Biological  
22 Report Series, which deals with all of the ornithological  
23 studies undertaken in 1971.

24 No aerial transects were flown  
25 in this region in 1972, but in 1973 aerial surveys were  
26 used to study the numbers and distribution of breeding  
27 and moulting water birds along the barrier beaches,  
28 spits, lagoons and bays of the Beaufort Sea Coast between  
29 Prudhoe Bay and the Mackenzie Delta. Our 1973 study is  
30 reported in Volume 26, Chapter 1 of the Biological Report

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

Series.

In August and September, 1973, 1974 and 1975, aerial surveys were also used to study the numbers, movements and distribution of staging snow geese on the Mackenzie Delta, Yukon North Slope and eastern Alaskan North Slope. The areas that were occupied by snow goose concentrations were plotted on maps to study their relationship to the proposed pipeline route. The results of our 1973 and 1974 surveys are contained in the Biological Report Series, Volume 27, Chapter 1 and Volume 30, Chapter 1, respectively. The results from 1975 are now in the process of compilation.

In 1971, we began ground transects to obtain population indices of terrestrial birds at twenty-two sites along the Beaufort Sea coast, the proposed coastal route, and the interior alternative route. The results of those surveys appear in Volume 10 of the Biological Report Series.

Transportation for ground survey work in 1971 was by fixed-wing aircraft, and this limited the choice of sites, particularly along the interior alternative in the Brooks Mountain Range. Accordingly, in 1972, additional sites along the interior alternative route were surveyed by ground transects through the use of a helicopter and a report of the results is included in Volume 12, Chapter 2 of the Biological Report Series. In 1973 many of the sites selected in 1971 and 1972 were re-surveyed to assess

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 the extent of natural variation of bird populations  
3 in different years. The results of this survey are  
4 contained in the Biological Report Series, Volume 29,  
5 Chapter 3.

6 In 1974 our transect program  
7 placed emphasis on sampling different habitats to  
8 provide further information on bird habitat preference,  
9 and bird population indices for different habitat types  
10 of the region. The results of this program are  
11 published in the Biological Report Series, Volume 30,  
12 Chapter 3. Our studies now provide a reasonable  
13 index of the species, populations, distribution and  
14 relative abundance of the more common land birds of the  
15 region.

16 LGL has also conducted some  
17 more selective baseline studies of birds in this region.  
18 The North Slope has many lakes of varying size and we  
19 felt it important to learn more about the types and  
20 numbers of waterfowl and shorebirds they support in  
21 summer. Accordingly, twenty-two of these lakes were  
22 surveyed in the Yukon in 1972 and sixty in 1973. They  
23 were chosen to be representative of lakes along the  
24 coastal area from Prudhoe Bay to the Mackenzie Delta.  
25 Information was obtained as to bird species, numbers  
26 and productivity on these lakes. Statistical comparison  
27 of the results enabled us to identify the types of  
28 lakes that were heavily used by birds and were highly  
29 productive, thus warranting special protection. It  
30 also enabled us to identify the types that were little  
used by birds and were largely unproductive. If lakes

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 are to be used for water for camp sites, and so on,  
3 these latter type lakes may better be selected for  
4 water withdrawal, at least as far as birds are concerned.  
5 The results of these studies are reported in Volume 12,  
6 Capter 1 (1972 study) and Volume 29, Chapter 1 (1973  
7 study) of the Biological Report Series.

8 A few words about LGL's  
9 ground survey methods might be in order here. There  
10 are a number of methods of endeavouring to determine the  
11 bird population of a given area in a particular period  
12 of time. Every method so far devised has its biases and  
13 weaknesses, including the transect method we have used  
14 extensively. Another method, termed the plot method,  
15 measures breeding bird populations by intensive  
16 coverage of a relatively small area. A comparison of  
17 the results obtained by the two methods for the same  
18 area helps to identify the biases and to permit cor-  
19 rection figures to be developed for some of the  
20 commoner species. In 1973, LGL conducted such a com-  
21 parative study on the North Slope in the Babbage River  
22 Drainage of the Yukon Territory. This reported in the  
23 Biological Report Series, Volume 26, Chapter 2.

24 A highly important ornitho-  
25 logical aspect of the Beaufort Sea Coast is the bird  
26 migration that takes place east and west along the  
27 coast. In 1972, LGL instituted an autumn migration  
28 watch at Nunaluk Spit on the Yukon North Coast from  
29 July 10th to September 17th. A total of 240,000 birds  
30 representing more than fifty species was estimated to  
have passed within sight of this location in east or

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 west migration during this period. The report of the  
3 study is contained in Volume 13, Chapter 3 of the  
4 Biological Report Series.

5 In the Mackenzie Region  
6 extending south from the Delta along the proposed routes  
7 to the 60th parallel north, I can say in summary that  
8 baseline studies similar to those in the Northern Region  
9 were conducted during the period 1971-1974. Preliminary  
10 aerial studies were flown in the spring, summer and  
11 autumn of 1972. The results of these surveys are  
12 contained in Volume 10, and Volume 11, Chapter 1, of  
13 the Biological Report Series.

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

In 1973, an additional aerial waterfowl survey was flown along a proposed route change in the Travaillant Lake area for comparison with data from previous surveys. A report of this survey is contained in Volume 28, Chapter 1, of the Biological Report Series.

With respect to the Prime Route, aerial surveys were flown in 1975 along the proposed Fort Simpson re-alignment.

Rare and endangered bird species form a particularly important aspect of our ornithological studies. In regard to the locations of nest-sites of peregrine falcons, we have worked in close association with the Canadian Wildlife Service, which maintains a working file of all known peregrine nest-sites. Disturbance studies related to the peregrine falcon will be outlined later in my testimony. A concentration of bald eagle nest-sites found close to the proposed pipeline route near the 60th Parallel North has been checked by aerial surveys in 1972, 1973 and 1974. Our 1972, 1973, and 1974 reports are contained in Volume 11, Chapter 2, Volume 26, Chapter 3 and Volume 31, Chapter 3 of the Biological Report Series, respectively.

Ground surveys of the terrestrial bird populations were begun in 1972, using the transect method, at selected sites roughly fifty miles apart along the proposed routes. The results of these surveys are incorporated in Volume 12, Chapter 2, of the Biological Report Series. Such surveys were

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 continued and extended in 1973 and 1974, to a total  
2 of more than forty sites, in order to obtain readings  
3 at the same sites in different years and to obtain  
4 statistically satisfactory samples of the principal  
5 habitats. Our 1973 studies are reported in Volume 29,  
6 Chapter 3 of the Biological Report Series and the results  
7 of our 1974 studies have been supplied to Arctic Gas.  
8 I should add that they now appear in Volume 31,  
9 Chapter 1 of the Biological Report Series.

10  
11 In 1975, ground surveys  
12 were extended to include the Cross-Delta alternative  
13 route and the proposed Fort Simpson re-alignment route.  
14 Results of these surveys are in final preparation.

15 As part of the inter-  
16 disciplinary studies undertaken in the boreal forest  
17 at Chick Lake in the Northwest Territories in 1973,  
18 1974 and 1975, LGL has made a comparative study of the  
19 results of the transect and plot methods of obtaining  
20 bird population indices with useful results. We have  
21 submitted such results from 1973 and 1974 to Arctic  
22 Gas and the results from 1975 are in final preparation.

23 Bird migration studies  
24 were also undertaken in the Makcenzie Region. Spring  
25 migration was studied in the upper Mackenzie Valley in  
26 May, 1972, and the results are reported in Volume 13,  
27 Chapter 1 of the Biological Report Series. Spring  
28 migration was again studied in the central and upper  
29 Mackenzie Valley in April and May, 1973, and the results  
30 are reported in Volume 28, Chapter 2 of the Biological

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Report Series. Autumn migration through the same region was studied in 1972 and the results of that study are contained in Volume 13, Chapter 2 of the Biological Report Series. One important point established by these studies was that in spring, waterfowl tend to follow closely the Mackenzie River which opens before the adjacent icebound lakes, and they make considerable use of the islands in the lower river for feeding, nesting and mating. By contrast, in autumn the lakes are still open and provide good food sources; in consequence, they are extensively used by migrating waterfowl.

This concludes my review of the baseline ornithological studies conducted to date. Now I should like to describe the disturbance studies that we have conducted.

I should first explain the rationale underlying our approach to the bird disturbance studies. We reviewed the literature, but could find no reference to comparable disturbance studies. Therefore, we had to devise our own techniques for experiments to be conducted under field conditions. We considered the types of disturbances likely to arise from the construction and operation of a gas pipeline and divided them into three categories:

1. human presence and activity;
  2. aircraft activity; and,
  3. noise, such as
- would arise from the operation of a compressor station

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

or from construction equipment and machinery.

Nearly all our experimental disturbance studies took place on the Yukon North Slope.

The first such study related to human presence and activity was conducted in 1972 at a camp on the Firth River in the Yukon Territory where about 20 people were working and there was a good deal of activity. Three experimental plots were laid out on the dry tussock tundra close to camp and similar control plots were laid out some distance away. A study of breeding bird populations and reproductive success was made on both series of plots and the results compared. The Lapland longspur was the only species present in sufficient numbers to provide an acceptably large statistical sample. There proved to be no statistically significant difference in the number of pairs of longspurs nesting in the two series of plots, but the reproductive success on the experimental plots was lower to a marginally significant degree compared to the control plots. The report of this experiment appears as part of Chapter 3, Volume 14 of the Biological Report Series.

In 1972, we also conducted a combined human and aircraft disturbance studies of nesting birds on the Barrier Beach. The presence of humans affected incubating behaviour and could have adversely affect reproductive results if carried on for any length of time. Results of this study were reported in Volume 14, Chapter 4 of the Biological Report Series.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 A number of different types  
2 of aircraft disturbance studies have also been  
3 carried out.

4 In 1972, an aircraft distur-  
5 bance study was carried out at the Firth River Camp  
6 in parallel with the human disturbance study and the  
7 results were similar. Helicopters were regularly  
8 flown over experimental plots at low levels and the num-  
9 ber of breeding pairs and reproductive success was com-  
10 pared with findings on the control plots. Again, the  
11 Lapland longspur was the only species present in  
12 sufficient numbers for a statistical analysis. The  
13 number of breeding pairs of longspur was not statistica-  
14 lly different between experimental and control plots,  
15 but the lower reproductive success on the experimental  
16 plots was marginally significant.

17 THE COMMISSIONER: Excuse me,  
18 Dr. Gunn, that is the second time--

19 A Yes sir.

20 Q --You used that  
21 expression "marginally significant". You used it before.

22 A Yes sir.

23 Q In relation to the  
24 study of the breeding near that camp.

25 A Right. Would you like  
26 me to explain what I mean by "marginally significant"?  
27 It's really an accepted way of describing the results  
28 as obtained on a percentage basis statistically, and  
29 it's a matter of probability. If your results give  
30 you figures which indicate that say such results could

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 be obtained by chance only once in 100 times, you  
2 would consider that to be quite significant or just  
3 significant. But if results indicate that by chance  
4 such a result could be obtained say once in 20 times,  
5 then it begins to be not quite so certain and I would  
6 classify that as marginally significant. There is a  
7 probable significance, but because it could happen  
8 by chance say once in 20 times, then it's not as  
9 positively significant as if it were only once in  
10 100 times.

11 So in this case the results  
12 that we got were such that it could have arisen by  
13 chance say once in 20 times and we think it significant  
14 but we put the word "marginally" in there because there  
15 is a possibility that simply by pure chance it might  
16 have happened.

17 Q I understand that last  
18 sentence or two, but the numbers confused me. Well,  
19 let's get this straight, if we can. You said that  
20 the reproductive success of the experimental plots  
21 was lower than on the control plots.

22 A Yes.

23 Q Now, you didn't feel  
24 that you could ascribe that to chance, the probability  
25 was that it was owing to the disturbance factor but  
26 it might have been something that occurred by chance.  
27 That's essentially what it means?

28 A Yes sir, that is true,  
29 and the possibility that it might have occurred by  
30 chance was a once in 20 times. If it had only been once

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 in 100 times, then we would have considered it to  
2 be highly significant, or more than 100 times.

3 Q You know that I follow  
4 you until you use "significant to something to the  
5 chance that seems most insignificant." That's what is  
6 throwing me off here,.

7 A It's the converse, sir,  
8 that if through chance it occurs only once in 100  
9 times, then if that number comes up through the  
10 experiment we consider it highly likely that the  
11 result was caused by disturbance.

12 Q I'm with you, all right,  
13 I follow you. Carry on.

14 A All right, sir.

15 THE COMMISSIONER:  
16 They're all pretending  
17 they understand.

18 MR. MARSHALL: Some of us  
19 get up earlier than others, eh.

20 A Those last results were  
21 reported in Chapter 3, Volume 14 of the Biological  
22 Report series. A re-reading of these plots by the  
23 transect method in 1973 gave some indication of  
24 persistence of effect in terms of relatively lower  
25 numbers of pairs of longspurs on the experimental plots  
26 in the following year as is reported in Volume 26,  
27 Chapter 4, of the Biological Report series.

28 In the Barrier Beach  
29 experiment of 1972 on nesting birds, aircraft over-  
30 flights produced the following results: Helicopters

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 (at 1,000 feet) were more disturbing to birds than  
2 fixed-wing aircraft (accordingly, I would prefer that  
3 where possible fixed-wing aircraft be used rather than  
4 helicopters); non-incubating birds showed a greater in-  
5 tolerance than incubating birds; black brant, glaucous  
6 gulls and Arctic terns were clearly affected, but  
7 incubating common eiders less obviously so. The  
8 significance of that, sir, I think, is that if the birds  
9 were sitting on eggs and incubating, they were less  
10 likely to leave them than if they were not sitting  
11 on eggs. The results of this study are reported in  
12 Volume 14, Chapter 4 of the Biological Report series.

13 In June of 1972 a light  
14 aircraft on floats was used to disturb waterfowl on  
15 a small lake and a large lake on the Yukon North Slope.  
16 The results of these studies are contained in Volume  
17 14, Chapter 1 of the Biological Report series. Similar-  
18 ly, we conducted a study on a lake near Inuvik in the  
19 Northwest Territories, that is used as a base for float  
20 planes. This is reported in Volume 14, Chapter 6 of the  
21 Biological Report series. These studies showed that  
22 some water birds evidenced a tolerance to float plane  
23 traffic, while others did not.

24 The effects of aircraft dis-  
25 turbance on moulting sea ducks were examined at Her-  
26 schel Island, Yukon Territory, in August of 1972 and  
27 '73. Helicopter overflights at 100/<sup>meters</sup>(330 feet) caused  
28 an immediate but apparently non-persistent effect.  
29 Overflights at 300 meters (1, 000 feet) did not appear  
30 to disturb the sea ducks. They were not driven from the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 area in either case. The results of our studies are  
2 published in Volume 14, Chapter 5, and Volume 29,  
3 Chapter 2 of the Biological Report series.

Jakimchuk, McCart.  
In Chief.

The effects of disturbance of flocks of snow geese by aircraft were examined on the North Slope in 1972 and 1973. Snow geese were found to be fairly sensitive to the presence of aircraft, showing evidence of disturbance by flushing at a mean distance of 1.6 miles from small aircraft, 2.5 miles from large aircraft, and 2.3 miles from small helicopters. In terms of aircraft altitudes, geese were observed to flush in response to aircraft altitudes of 8000 to 10,000 feet, the maximum height at which the plane was flown. Deliberate hazing of flocks in an area approximately five miles by ten miles cleared out the geese in about fifteen minutes. The results of our 1972 study are published in Volume 14, Chapter 7 and of our 1973 study in Volume 27, Chapter 2 in the Biological Report Series.

The study in 1973 determined that undisturbed snow geese spent 57% of daylight hours feeding. For juveniles this was 65 to 70%. Geese flushed farther from helicopters than light fixed-wing aircraft. Experimental flights at both two-hour and one-half hour intervals indicated some partial accommodation to frequency. Disturbance from existing aircraft traffic in 1973 averaged 0.25 flights per daylight hour. Analysis of our data on rates of disturbance and the acquisition of energy reserves by juvenile geese indicate that a potentially severe problem could arise if the rate of aircraft flights were allowed to rise to 0.5 flights per hour, Biological Report Series, Volume 27, Chapter 2.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 The results of the snow goose  
3 experiments in 1972 led to a study in 1973 of the  
4 bioenergetics of snow geese on the North Slope during  
5 the autumn staging period, August 15 to September 30.  
6 During an average stay of eighteen days, geese increased  
7 their body weights in the range of 9 to 23% and their  
8 fat reserves from 45% in adult males to 117% in  
9 juvenile females. This is reported in Volume 27,  
10 Chapter 4 of the Biological Report Series. This study  
11 indicated the importance of the staging area to snow  
12 geese in their preparation for the long migration  
13 southward. In 1975, however, our studies indicated that  
14 because of an early snowfall, snow geese were able to  
15 make very little use of the North Slope and remained  
16 principally in the Mackenzie Delta.

17 Another aircraft disturbance--

18 THE COMMISSIONER: That is  
19 they used the Mackenzie Delta as their staging area  
20 before heading south?

21 A Yes, sir.

22 THE COMMISSIONER: Yes.

23 A That's correct. On  
24 September 5, there was a snowfall that left four or  
25 five inches on the North Slope and they largely withdrew  
26 to the Mackenzie Delta.

27 MR. MARSHALL: Dr. Gunn,  
28 perhaps you could just give some detail as to where  
29 in the Mackenzie Delta they concentrated in 1975?

30 A In 1975, there was also snow

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 on the outer fringes of the outer delta and the snow  
3 geese, and there are <sup>about</sup> 350,000 of them, tended to con-  
4 centrate in a band across the more southernly parts  
5 of the outer delta from Shallow Bay in the west across  
6 to Kittigazuit Bay in the east. The band across there,  
7 which was not all snow-covered, there were still green  
8 areas open, they stayed out of the forested area to the  
9 south, the inner delta, but they were in a band across  
10 the outer delta.

11 THE COMMISSIONER: About  
12 350,000 of them?

13 A Yes, sir.

14 THE COMMISSIONER: And are  
15 you familiar with the route that Arctic Gas proposes to  
16 take across the mouth of the delta?

17 A Yes, sir.

18 THE COMMISSIONER: Where were  
19 they in relation to that route?

20 A They were very close to it,  
21 sir, on both sides of that route.

22 Another aircraft disturbance  
23 study was begun in 1974 with the commencement of two to  
24 three year study of diurnal raptors, golden eagle rough-  
25 legged hawk and peregrine falcon, with specific emphasis  
26 on gyrfalcons that nest on the North Slope of the Yukon  
27 Territory. We have also surveyed the North Slope in  
28 cooperation with the Canadian Wildlife Service for  
29 occupancy and productivity of gyrfalcons. Gyrfalcons,  
30 although rare, are not endangered but are closely

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 related to the rare and endangered peregrine falcons  
3 whose few remaining active nest sites in North America  
4 include a small number in the Alaskan and Yukon North  
5 Slope and Mackenzie Valley regions. By extrapolation,  
6 it is hoped that what is learned about the aircraft  
7 disturbance thresholds of gyrfalcons can also be applied  
8 to the peregrine falcon and other nesting raptors such  
9 as the golden eagle. In 1974, it was found that  
10 helicopter passes at 500 feet altitude caused in-  
11 cubating birds to leave their nests even at low tem-  
12 peratures in March and April. At 1000 feet, birds  
13 remained on the nest but showed indications of stress.  
14 The study was continued in 1975 with particular emphasis  
15 on finding height and distance disturbance thresholds.  
16 The results of our 1974 study of raptors have been  
17 supplied to Arctic Gas, and I should say that they are  
18 now reported in Volume 30, Chapter II of the Biological  
19 Report Series. Preliminary results from 1975 indicate  
20 that overflights at 2000 feet above ground level are  
21 above the threshold of visible disturbance.

22 In our noise disturbance studies,  
23 we used gas compressor sound simulators designed to  
24 reproduce frequencies and intensities of sound developed  
25 by a 20,000 horsepower gas compressor station. Our  
26 first experiment was carried out near the Babbage River,  
27 Yukon Territory, in June of 1972. We set up the sound  
28 simulator and established experimental bird plots in  
29 the immediate vicinity. At some distance, we also set  
30 up control plots. The sound was run continuously through

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1 the nesting period and censuses of the birds nesting in  
2 all plots were taken and compared. The Lapland  
3 longspur was the only species present in sufficient  
4 numbers to provide a statistical comparison. There  
5 was no significant statistical difference in the numbers  
6 and reproductive success of this species between the  
7 experimental and control plots. The results of this  
8 study are reported in Volume 14, Chapter. 2 of the  
9 Biological Report Series.  
10

11 In September 1972, the sound  
12 simulator was set up in the vicinity of Komakuk Beach,  
13 Yukon Territory, in an area frequented by flocks of  
14 snow geese. Decoys were set out within the range of  
15 the sound simulator to attract geese. The behaviour  
16 of geese was studied when the sound simulator was operating  
17 and when it was not operating. It was found that goose  
18 flocks did not feed any closer than 1.5 miles from the  
19 simulator when operating, and birds flying over the  
20 simulator were frequently diverted from their course  
21 by as much as 90 degrees or greater. This study was  
22 reported in Volume 14, Chapter 8 of the Biological  
23 Report Series.

24 A similar study was conducted  
25 in August and September of 1973 in the same area. In  
26 this experiment, and in the 1972 experiment, the sound  
27 simulator was only operating at about half of its  
28 maximum volume. During the period of this experiment,  
29 feeding flocks of geese approached no closer than half  
30 a mile to the simulator's north side where the sound

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 was most intense. Flocks flying overhead were also  
3 diverted but in this case considerably less than 90  
4 degrees.

1  
2 From these last two experiments it is evident that  
3 geese are unlikely to land and feed within about 1.5  
4 miles of a gas compressor station and that they may  
5 be diverted while in flight, but their passage across  
6 the area of a gas compressor station will not be pre-  
7 vented. Results of this study were reported in Volume  
8 27, Chapter 3 of the Biological Report Series.

9 From the results of our  
10 surveys and experimental studies, we have been able to  
11 identify some sixteen ornithologically sensitive areas  
12 along or close to the proposed prime route or primary  
13 alternatives to the route between Prudhoe Bay and nor-  
14 thern Alberta.

15 Dealing with these by re-  
16 gion, I will attempt to delineate the area, and state  
17 the type of birds involved and the relevant period of the  
18 year.

19 Beginning with the por-  
20 tion of the Prime Route between Prudhoe Bay and  
21 Mackenzie Delta, the following five areas are consid-  
22 ered ornithologically sensitive at certain times of  
23 year:

24 1. Beaufort Sea coast,  
25 including bays, spits, lagoons and barrier islands;  
26 used by large numbers of migratory, breeding and  
27 moulting waterfowl, other water birds, and shorebirds,  
28 between May and October.

29 2. Wet sedge tundra  
30 extending east and south from Prudhoe Bay for a dis-

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 tance of about 50 miles; an important breeding area  
3 for shorebirds and some water birds, from the end of  
4 May to the end of September.

5 3. Willow thickets bor-  
6 dering northward flowing rivers on the North Slope  
7 between Prodhoe Bay and the Mackenzie Delta; used as  
8 wintering areas by ptarmigan from November to April.

9 4. Major portions of the  
10 North Slope eastward from the Canning River to the  
11 Mackenzie Delta; used by snow geese from mid-to-late  
12 August until late September, occasionally until  
13 mid-October.

14 5. Certain steep valley  
15 slopes and promontories along the foothills of the  
16 British mountains from the Alaskan border to the  
17 Mackenzie Delta; used as nesting sites by gyrfalcons  
18 (March to July) and other raptors from May to August.

19 Along the Interior  
20 Alternative route, there are two areas notably sensi-  
21 tive:

22 1. Steep valley slopes  
23 of the Canning River, used as nest-sites by gyrfalcons  
24 from March to July, peregrine falcons and other raptors  
25 from May to August.

26 2. The Old Crow Flats,  
27 an important staging and breeding area for waterfowl.

28 The whole of the Mack-  
29 enzie Delta is ornithologically sensitive; the outer  
30 delta is a staging and breeding area for whistling

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 swans, three species of geese, and other water-  
3 related birds such as sandhill cranes from mid-May to  
4 October; the inner delta is a prime staging, breeding  
5 and moulting area for ducks, shorebirds and land birds.

6 Southward along the Prime  
7 Route up the Mackenzie Valley, sensitive areas are more  
8 restricted and are made up chiefly of two types --  
9 those involving raptor nest-sites, and those involving  
10 staging and nesting sites for waterfowl.

11 There are nest-sites of  
12 the endangered peregrine falcon and other raptors along  
13 the proposed Prime Route in the Campbell Hills and in  
14 the vicinity of the Arctic Red River, and also in the  
15 Norman Range and (probably) the McConnel Range of the  
16 Franklin Mountains. Of these, it is known that at  
17 least 11 lie within 3 miles of the proposed route.

18 On the Mackenzie River,  
19 the islands and sandbars from Arctic Red River south  
20 to Wrigley are key resting and copulating sites for  
21 migrating swans, geese, ducks and shorebirds in spring  
22 in May and June.

23 Two clusters of small to  
24 medium-sized lakes north and south of Norman Wells and  
25 another about 30 miles southeast of Fort Simpson are  
26 productive nesting and important moulting sites for  
27 waterfowl.

28 In general, there are  
29 three principal methods of avoiding or mitigating  
30 impacts on these ornithologically sensitive areas

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 during the construction and operation of a gas  
2 pipeline. One is through design and control of metho-  
3 dology. The second is through selective timing, parti-  
4 cularly through the various phases of construction.  
5 The third is through spatial adjustment of the routing,  
6 the supporting facilities and the associated activities.  
7

8 LGL's numerous recom-  
9 mendations to Northern Engineering Services and Arctic  
10 Gas incorporate aspects of all three of these methods.

11 For methodology, the  
12 principle is to construct and operate the pipeline in  
13 a manner that will cause the least short-term and long-  
14 term disturbance to the existing environment. Often  
15 this may not be the easiest or cheapest or most straight-  
16 forward way, but in our view it is the way that will  
17 produce the best results for ourselves and for other  
18 living things, birds included.

19 Because most bird activi-  
20 ties and distribution are highly seasonal, selective  
21 timing is usually the most practical approach to  
22 accommodation, and basically this means recommending  
23 that as much of the activity as possible be undertaken  
24 during the winter months when most birds are absent  
25 from the region.

26 Of the remaining  
27 activities that must be carried on during the summer  
28 months, many are of the type that could have detri-  
29 mental effects on bird populations of certain sensitive  
30 species and in certain sensitive locations of major  
importance to birds, as mentioned above. As means of

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

avoidance or mitigation, we are now left with spatial adjustments in the routing or location of facilities or in operational techniques such as the control of aircraft flight plans. These adjustments could range all the way from selection of one alternative routing over another, through minor adjustments in location of facilities or pipeline routing, to control of routing and frequency of aircraft flights and ship movements.

Let me now give some examples. In describing our disturbance experiments, we mentioned three principal forms: human presence, noise and aircraft.

In our view, human presence is one of the most serious causes of disturbance to birds, and one to which some birds will accommodate very slowly, if at all. In winter, when most birds are absent, there is little concern except in the special cases of ptarmigan overwintering in willows of stream valleys and of gyrfalcon nest-sites, which begin to be occupied as early as February. From May through October, however, especially on the tundra with its high visibility, human presence should be as inconspicuous and infrequent as possible. Personnel working on staging and facility sites should confine themselves to those sites and not go wandering over the countryside. In particular, the coastal spits and barrier beaches of the North Slope should be avoided.

We believe that most birds will accommodate fairly well to most types of

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 noise likely to be associated with construction. In  
2 the case of gas compressor stations, a special effort  
3 should be made to attenuate their sounds in areas on  
4 the North Slope and the Mackenzie Delta at locations  
5 frequented by geese and swans. We have tentatively  
6 set a maximum level of 50dB on the A scale at a dis-  
7 tance of 1000 feet as being acceptable. If in practice,  
8 this level turns out to be say, 56dBA at 1000 feet,  
9 this simply means that the disturbance area might have  
10 a radius of 2 or 2 1/2 miles, instead of about 1 1/2  
11 miles.

12 Three of these stations --  
13 compressor stations -- CA-03, CA-05, and CA-06, have  
14 been located in areas known to support concentrations  
15 of snow geese during the fall staging period. Two of  
16 these are also close to small clusters of rare and en-  
17 dangered raptor sites. We have recommended shifts in  
18 location for these stations to mitigate the probable  
19 disturbance. A similar situation exists with respect  
20 to rare and endangered peregrine falcon nest-sites  
21 on the slopes of the Norman Range close to compressor  
22 sites and valve stations.

23  
24  
25  
26  
27  
28  
29  
30

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 At one time we were consider-  
2 ably concerned about the chronic hazard to migrating  
3 birds presented by antennae and communication towers,  
4 some of which were designed to exceed 300 feet. This  
5 was especially true for those planned for the Mackenzie  
6 Valley and the tundra and Beauford Sea coast. However,  
7 we have been given to understand that a satellite com-  
8 munication system is now planned to take the place of  
9 the conventional system requiring towers.

10 Because of the known sensiti-  
11 vity of raptors, waterfowl and other birds to fixed wing  
12 aircraft and helicopters, we have made detailed recom-  
13 mendations regarding aircraft routing, altitudes and  
14 frequency of flights in the vicinity of areas of  
15 concern, such as the bald eagle nesting lakes near the  
16 60th Parallel, the islands in the lower Mackenzie,  
17 known raptor nest-sites along the route, the Mackenzie  
18 Delta, the North Slope, and the Beaufort Sea Coast.  
19 Perhaps most interesting and of greatest concern is  
20 the effect of passing aircraft on snow geese during  
21 the staging period on the North Slope from mid-August  
22 to early October. During this period, we have calcula-  
23 ted the present air traffic overflying goose flocks as  
24 0.25 flights per hour. From our observations of their  
25 behaviour and a physiological study of their energy  
26 requirements, we have calculated that a potentially  
27 serious impact ~~could~~ occur in juvenile geese if this  
28 rate were allowed to increase to 0.5 flights per hour.  
29 This could come about through a combination of reduced  
30 feeding time and increased energy consumption as a result

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 of disturbance. We have therefore recommended that  
2 flight frequency be limited in this period to 0.25  
3 flights per hour, but this is a matter that would  
4 have to be controlled by the Ministry of Transport and  
5 the U.S. Federal Aviation Administration rather than  
6 simply by Arctic Gas.

7 Our recommendation for minimum  
8 altitudes for aircraft activity over ornithologically  
9 sensitive areas is 2,000 feet above ground level but  
10 even this height is insufficient to prevent disturbance  
11 of geese and spacing of flights will be required to  
12 mitigate disturbance.

13 I would now like to conclude  
14 by making a few comments on our preferences and  
15 recommendations regarding alternate routes.

16 We had no preference in regard  
17 to the alternatives on the east and west sides of the  
18 Mackenzie River, and we prefer the Fort Simpson by-pass  
19 to the previous prime route section, so that no problem  
20 has arisen there in either case. On the other hand,  
21 we expect that our ornithological recommendations  
22 of the interior alternative route over the prime  
23 coastal route may run against the grain of engineering  
24 and economic and other environmental preference.

25 Ornithologically, the choice  
26 between the interior alternative and the coastal route  
27 boiled down to a very few factors. On the interior  
28 route the principal concern has to do with about 15  
29 important raptor nest sites, two or three of them being  
30 peregrine falcon nests, chiefly in the Canning Valley

in Alaska, and all within three miles of the proposed route. Because of the topography, little accommodation can be afforded through minor route changes. Plans call for two winters and two summers of construction in the Alaskan sector and so these nest-sites would be subject to considerable disturbance for two nesting seasons, perhaps causing some birds to desert the nest or young. Other ornithological concerns along -- I had to change that word "environmental" to "ornithological" -- concerns along the interior alternative are relatively minor, but it also has the advantage of avoiding the Mackenzie Delta.

There are 10 or 12 important raptor nest-sites, two or three of them of a rare and endangered species, peregrine falcon, along the prime coastal routes, but they should receive less disturbance because pipe-laying would take place during one winter. Some summer activities in their vicinity are to be expected, however. The principal ornithological concern on this section of the prime route is the possibility of any factor or combination of factors that would have a detrimental effect on the viability of the Beaufort Sea coast as a multi-purpose facility for birds. Our idea of the worst possible ornithological scenario that could arise from pipeline activity would be serious, prolonged environmental damage to this ecosystem. We are aware that such a possibility is remote, but because it cannot be entirely discounted, we prefer to go with the more probable but more limited hazards of the interior alternative.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 THE COMMISSIONER: Excuse me,  
2 Dr. Gunn.

3 A Yes sir.

4 Q When you're talking  
5 about the Beaufort Sea coast, you're talking about  
6 the Prudhoe Bay right over to and including the  
7 Mackenzie Delta, is that --

8 A No sir, in this context  
9 we are covering it to the western edge of the Mackenzie  
10 Delta, yes.

11 Q Dr. Livingston gave  
12 evidence in the overview days of the hearings and his  
13 concern appeared to be identical, though not as  
14 elaborately articulated as your own now. I gather  
15 you are a colleague of his, from what you say.

16 A Yes sir, he used to  
17 be a partner in our firm.

18 Q Oh, I see. Carry on.

19 A All right, sir.

20 In sum, while we prefer the  
21 interior alternative route, we believe it is possible  
22 to build the proposed gas pipeline along the prime  
23 route -- and by this I mean the old prime  
24 route -- without serious long-term damage to bird  
25 populations, but only if our recommendations are care-  
26 fully followed and that particular care is taken to  
27 avoid pollution along the Beaufort Sea coast. I have  
28 examined the DINA Northern Pipeline Guidelines, and the  
29 applicable N.E.B. regulations, and from the perspective  
30 of my discipline, I think the pipeline can be built to

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 conform with ~~their~~ intent.

2 Q Dr. Gunn, I believe you  
3 have some slides you would like to present now.

4 A Yes sir, if you wish I  
5 have some slides I can show, it will take about ten  
6 minutes.

7 Q Yes, certainly. Just  
8 before you do that, the -- you packed a great deal  
9 into these pages and it's certainly all, I think are  
10 very interested in the subject. Just looking at your  
11 very last paragraph here, the reason that you would  
12 prefer that they go through the interior of Alaska and  
13 the interior of the Yukon is because you want them to  
14 stay away from the coast. That's --

15 A Yes sir.

16 Q And that's because the  
17 coast is the nesting ground for many species and  
18 the staging ground for the snow geese, that come from  
19 the Arctic Islands.

20 A The slope is a staging  
21 ground for the snow geese in fall between mid-August  
22 and early October. The coast itself is a migration  
23 route, a two-way migration route. Some birds travel  
24 from west to east, some from east to west, both in  
25 spring and fall. Birds nest along the coast and they  
26 also use it as moulting areas and staging areas  
27 preparatory to migration.

28 Q Now, there's two things  
29 you might just think about, and as I say, deal with  
30 them later in the week as Mr. Marshall suggested, or

Ban field, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 not at all if you don't wish to; but the one is that  
2 the prime route that Arctic Gas now wants to build  
3 a pipeline along is a route that goes along the North  
4 Slope of the Yukon, and then across the mouth of the  
5 Mackenzie Delta. You're familiar with the route?

6 A Yes sir.

7 Q So that given that prime  
8 route, you may want to indicate or you may not want to,  
9 but if you do I'd appreciate it, whether that alters  
10 your opinion you've expressed in the last paragraph.

11 A The result of our  
12 study this year, sir, they haven't been completely  
13 analyzed but from what I know now, I have serious  
14 reservations about the cross-delta route.

15 Q All right. Now the other  
16 thing that concerns me, and I talked about this last  
17 night, is that, for example the present rate of over-  
18 flights on the North Slope is 0.25 per hour. I think  
19 you said that.

20 A Yes, they are. Those  
21 figures were taken at the time of year when the  
22 snow geese were on the slope, that is mid-August to --  
23 the end of September.

24

25

26

27

28

29

30

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Q Now, what concerns me  
is this. You said that your recommendation was that  
overflights should be kept during that period of the  
year at that level.

A Yes.

Q That if they doubled,  
that is if the frequency of flights doubled from .25  
to .5 per hour, there could well be serious disturbance.

A Yes.

Q I think that's what  
you said. Now, if all that there were proposed, if  
all that were going to happen on the north coast were  
simply the building of this gas pipeline, I suppose  
that the Minister of Transport and so on and so forth  
could restrict flights but what concerns me and I think  
should concern all of us is that Mr. Blair, the  
President of Foothills said that the -- if you build  
a pipeline, you get enhanced oil and gas exploration  
activity which seems logical.

So you would then  
concievably have enhanced oil and gas exploration  
activity on the north coast and much greater use of  
aircraft and you might control the whole situation with  
a gas pipeline and then find afterwards that you were  
running into difficulties because of enhanced oil and  
gas exploration activity and then, of course, you  
might at some time in the future face the second gas  
pipeline or an oil pipeline.

Well, you don't have to

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 deal with those questions now and you don't have to  
2 later on if you don't wish to but what concerns me is  
3 that you have done an obviously an extremely thorough  
4 analysis in relation to the gas pipeline but none of us  
5 should treat the gas pipeline as if that was something  
6 that could be allowed to occur and nothing occur  
7 thereafter. That's -- you see the problem -- and  
8 you might wish to think about it.

9  
10 A Yes, sir. Well, the  
11 same results and principles will apply in my view as  
12 it's necessary to maintain spacing of flights and to,  
13 not to allow it to increase to the .5 level but this  
14 is only the period from mid-August to early October and  
15 whatever happens up there, I feel that for the safety  
16 of the geese that the intensities of flight need to  
17 be kept to that maximum.

18 Q Yes, oh I quite understand  
19 and it's not just a case of limiting -- of making  
20 sure we don't limit our consideration simply to the  
21 gas pipeline -- to make sure we don't limit it simply  
22 to birds because someone is on this panel, I suspect,  
23 is going to say well, earlier in the year, from the  
24 beginning of May to mid-June, you can't have any  
25 overflights over the North Slope in excess of a certain  
26 frequency because the caribou are calving.

27 At any rate, let's go  
28 ahead and have the slides.

29 A If, I may, sir, I'll  
30 come down there and work the projector. I don't cover  
the whole subject but I do illustrate a few of the

Hemstock, Dabbs, McCart, Gunn  
Jakimchuk, Banfield--In Chief

1 points I am talking about.

2 Most of our work, sir,  
3 entails standing at one point watching birds go by or  
4 watching their behaviour or alternatively walking along  
5 certain preselected routes to see what birds are there.

6 This stalwart fellow is  
7 standing at a vantage point near Norman Wells watching  
8 spring migration, watching birds go over such as these  
9 snowgeese coming north in the spring and of course,  
10 most of the traffic is much lower down the water fowl  
11 and other birds are going past him at lower levels.

12 This is a typical camp-  
13 site on the North Slope with our little group of tents  
14 in the foreground there. And from there, we have done  
15 transects to see what birds are there at that time of  
16 the year.

17 Here we are walking across  
18 the tussock tundra. And birds that commonly turn up  
19 are birds such as this rock ptarmigan, and golden plover,  
20 and this is the Lapland longspur that I talked about,  
21 a small songbird that is very common in that area.

22 Where willows begin to  
23 take on a shrubby experience, there is another kind of  
24 ptarmigan there, the willow ptarmigan, it is one of  
25 the common birds on the tundra.

26 The lakes of the tundra  
27 area are occupied by birds such as these Arctic loons  
28 as soon as the ice goes off. This is a northern  
29 phalarope commonly found there in summer. It's a type  
30 of shorebird.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 And there are many sand-  
3 pipers such as this semi-palmated sandpiper and this  
4 stilt sandpiper, a little larger. And there are three  
5 types of jaeger there. Jaeger is a relative of the  
6 gulls. It is a predator. This is the long-tailed  
7 jaeger.

8 As we look at these  
9 lakes and studied their productivity, we found that  
10 lakes such as this with steep banks and not much  
11 vegetation along the edge with rather straight edges  
12 were much less productive for birds than lakes such as  
13 these with gentle slopes and streams coming in or  
14 leaving and vegetation along the edge.

15 The vegetation along the  
16 edge is important for many young birds such as these  
17 young swans. The barrier beaches, as I mentioned  
18 were also important to birds, particularly as they  
19 provide sheltered lagoons and here in the bottom  
20 right-hand corner, you see some water fowl resting and  
21 sheltering on the edge protected from the ice out in the  
22 Beaufort Sea.

23 Here again, near Herschel  
24 Island are some old squaw ducks, some of them, many  
25 thousands that spend part of the summer there, moulting  
26 in the sheltered areas.

27 White-fronted geese  
28 move along the Beaufort Sea coast in considerable  
29 numbers and here are Brant geese, feeding on an islet  
30 at Demarcation Bay.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Other birds along the edge of  
the Arctic include the Arctic tern which comes all the  
way from the Antarctic to nest up here in the summer.

And the snow bunting, another  
small songbird which I link with the Lapland longspur.  
These are the two of the more common songbirds in the  
Arctic and they nest in the bits of flotsam jetsam  
along the beaches.

Up in the mountains,  
we had a look at these areas as we said in the Brooks  
Range in the British Mountains. There are not a great  
many birds there. One of the common small birds is this  
pivot found through the mountains and we mentioned the  
raptors that nest on the cliff slopes in the  
mountainous areas, in the rocky outcrops, not only along  
the Brooks Range and the British Mountains, but down  
through the or up the Mackenzie Valley.

This is a peregrine  
falcon and as you can see, it is a picture of a captive  
bird but it shows the bird very well.

This is the gyr falcon  
that we studied in some detail. And here is our falcon  
specialist using his tent as a blind to study their  
behaviour for long periods of time and he was up there  
starting as early as February doing that in forty below  
weather. Already at that time, the gyr falcons are  
starting to use their nest ledges.

Here he is putting bands  
on young gyr falcons at a time when their sufficiently

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 close to fledging this disturbance isn't likely to  
3 affect the productivity and he is doing that with the  
4 approval of the Canadian Wildlife Service who supply  
5 the bands.

6 This means that if they  
7 are encountered later, somewhere on the slope, we'll  
8 know their origin and we'll know how they disperse  
9 from the nest-sites.

1 THE COMMISSIONER: I take  
2 it he climbed up to that. Did he have a rope there?

3 A Yes, he lowers himself  
4 with a rope down -- either climbs up or lowers himself  
5 down. It's a fairly precarious thing to do, but he  
6 managed to do it quite successfully. It doesn't  
7 look like a very strong rope but it seemed to get him  
8 up and down.

9 Of course we were also in  
10 the boreal forest and in places that's dense going,  
11 in the valleys and the forest and the lakes in the  
12 boreal forest. The birds there are somewhat different.  
13 The loons now are the common loon and we come across  
14 some of the forest owls like this hawk owl, and many  
15 smaller birds. This is a gray jay or Canada jay or  
16 whiskeyjack, and they were very interested in what we  
17 did, so much so in fact that we tended to consider  
18 them more numerous than they actually were because they  
19 always turned up to see what we were doing. Then there  
20 were very many types of perching birds represented here  
21 by yellow warbler which comes up from Central and  
22 South America to nest near the forest edges and the  
23 boreal forest itself.

24 AS I mentioned, the islands in  
25 the Mackenzie River are particularly important to  
26 waterfowl migrating northward in the spring. This  
27 particular shot is of the sny, what they call the sny,  
28 the back part of the river behind Fort Simpson which is,  
29 as you know, on an island. It's important to birds  
30 in the spring and when the barges go down there, by the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 time they go down the birds have already departed, so  
2 they are unlikely to disturb the birds. The traffic  
3 we have to watch is the local traffic just after  
4 breakup.

5 We also looked at birds that  
6 frequent inhabited areas such as these gulls and ravens  
7 and in some places even longtailed jaegers. It's  
8 very important that where there are camps and people  
9 congregating that waste disposal is very effective,  
10 otherwise we get birds coming in from the wild and  
11 becoming semi-domesticated and scavenging on garbage  
12 and food scraps and in the long-term becoming more  
13 numerous than we would want them to be.

14 Now I'd like to show a sequence  
15 of slides dealing with the snow goose situation. This  
16 is a pair on their nesting grounds, and they nest -- the  
17 population that we deal with, nest very largely on Banks  
18 Island across the Beaufort Sea to the north-east, and  
19 after they have nested and the young are able to fly,  
20 and the adults have moulted, they fly down to the  
21 Mackenzie Delta, and some of them directly to the North  
22 Slope, and we see a flock here on the North Slope  
23 feeding, and the place at which the photograph was  
24 taken was less than five miles from the seacoast,  
25 so you can see that there's quite a narrow  
26 area in this region between the coast and the mountains,  
27 and the birds have to funnel their way through that  
28 westward and then return eastward.

29 Here is a flock, some on the  
30 ground feeding, some leap-frogging forward to establish

1 a new feeding area. The same kind of thing, the birds  
2 on the ground are alert, you can see their heads are  
3 up and they are concerned with the photographer's  
4 presence.

Here is an area where a goose has been feeding and it's a marked contrast to the vegetation around it. In some cases where feeding is very intensive, they almost clean off the polygons, such as this one. This is a long-distance view showing our two sound simulators in the middle ground on the left, pointing out over the slope and we observe the behaviour of geese in the vicinity of these things while they were running.

The cloud overcast is quite

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 typical of that time of year, and presents problems  
2 to aircraft. Then we of course also did aircraft  
3 experiments, watching the effect of overflights on  
4 flocks such as these. That's all I have, sir.

5 THE COMMISSIONER: Well, thank  
6 you very much.

7 MR. MARSHALL: Could we have  
8 the morning break at this point?

9 THE COMMISSIONER: Yes, I  
10 guess we might as well.

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

THE COMMISSIONER: We will come  
to order again ladies and gentlemen.

MR. MARSHALL: Mr. Commissioner,  
Mr. Jakimchuk will now present his evidence pertaining  
to mammals.

MR. JAKIMCHUK: The purpose  
of my testimony is to discuss the Applicant's proposed  
pipeline project in relation to its effect on mammals  
in the areas which would be traversed by the coastal  
pipeline route and the alternative interior route. In  
this regard I have considered the impact of the con-  
struction, operation and maintenance of the proposed  
pipeline and related facilities.

For the reasons, which I will  
develop, it is my opinion that if the proposed pipeline  
is constructed, operated and maintained in accordance  
with the construction and operation and maintenance  
plans contained in Section No.'s 13a and b, they will  
have no major adverse impact on mammals in the area and  
the anticipated impacts will be minor and local in  
nature.

Our involvement as consultants  
in this project commenced in early 1971. We were  
assigned the responsibility for mammal studies and  
commenced our field work in March of that year. At that  
time our client was Williams Brothers Canada Ltd.,  
predecessors of Northern Engineering Services Company  
Limited, the principal consultants of the Northwest

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

Project Study Group.

Our studies were broken down initially into two functional categories: studies of the Porcupine Caribou herd and studies of furbearing mammals such as beaver, muskrat, marten and Arctic fox. In fact, the scope of our studies have included all major mammalian taxa: ungulates, carnivores (large and small) and rodents.

The geographic area of study was extremely large and was oriented towards characteristics of the species of major importance as well as various routing alternatives including the coastal route, interior route and routings along both the east and west side of the Mackenzie River. In 1972 our studies were extended to include proposed routings in north-eastern Alaska and have continued in both Alaska and Canada since that time.

Our initial studies consisted of baseline surveys of populations and habitats. I will elaborate on the studies and their rationale later in my testimony.

During 1971 and 1972 I was personally involved in establishing study objectives, planning research, periodic field inspections, including participation in surveys; data analysis, report writing and editing. Subsequently my role was more heavily oriented to general supervision, editing and planning of projects.

We were able to draw upon the

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
In Chief.

1  
2 vast experience and expertise of Dr. Frank Banfield,  
3 advisory consultant to Canadian Arctic Gas from the  
4 outset of our studies, both for planning of programs  
5 and review of results and methodology.

6 Our initial studies were  
7 broadly based and not route-specific since we required  
8 a systematic baseline of mammalian fauna. In addition  
9 this allowed us to cover areas which, subsequently  
10 became route alternatives or where route alterations  
11 were made. Our study objectives were modified over the  
12 years as we were able to identify possible interactions  
13 between mammals and the pipeline routing as changes  
14 occurred and as engineering and design information was  
15 more completely developed.

16 The study area in the Yukon  
17 was extensive, primarily reflecting the wide range of  
18 the Porcupine Caribou herd. The area included the entire  
19 territory north of the Ogilvie Mountains to the coast.  
20 The study area also included a wide corridor on either  
21 side of the Mackenzie River in the Northwest Territories  
22 and corridors along the proposed routings in Alberta  
23 and British Columbia.

24 Mammal study areas generally  
25 encompassed the home range of animals which could be  
26 encountered or the extent of habitat which could be  
27 affected during pipeline construction and/or operation.

28 Hence, studies of highly mobile  
29 species such as caribou, grizzly bear, and wolves were  
30 wide ranging. Studies of furbearing mammals were more

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
In Chief.

restricted to habitats near pipeline routes.

Our major objectives were  
four-fold:

- 1) Gather baseline data on mammal populations and habitat;
- 2) To identify potential interactions between pipeline routing and mammal habitats and populations;
- 3) To assess the significance of these potential interactions, and;
- 4) To gather sufficient information to make recommendations regarding scheduling of construction, routing and mitigation of disturbing interactions.

Our rationale underlying the mammal studies was to carry out habitat-oriented studies for small mammals such as mice and fur-bearing species such as marten and beaver since they are more habitat specific than the large species such as caribou or grizzly bear. For the latter we focused primarily on the population because of the higher degree of mobility of these species and the large area in which interaction could take place along the proposed routings. Our studies were also based on the importance of a species or groups of species taking into account either their role in the ecosystem, their social or aesthetic importance, or their potential vulnerability to disturbance.

Our approach to studies of the

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 various mammal species which might be encountered by  
3 the pipeline, was governed by their anticipated vul-  
4 nerability to impact during pipeline construction and  
5 operation. Abundant, large, gregarious, highly-mobile  
6 mammals such as caribou were considered most vulner-  
7 able and consequently were studied intensively.

8 Initially our emphasis was on  
9 baseline investigations of populations and habitats.  
10 This provided us with essential information upon which  
11 to assess potential interactions and the relative  
12 importance of these. Following the acquisition of  
13 baseline information, we carried out what might be  
14 called problem solving and experimental studies on  
15 individual species such as caribou and Dall sheep. In  
16 these studies we gathered quantitative data on such  
17 factors as disturbance by aircraft, caribou utiliza-  
18 tion of seismic lines and winter roads and the effects  
19 of compressor station noise levels on the behaviour  
20 and activities of caribou and Dall sheep.

#### 21 METHODS

22 Study methods varied con-  
23 siderably according to research objectives. Both  
24 intensive and reconnaissance aerial surveys were carried  
25 out to obtain baseline information on habitats and  
26 populations. Site specific surveys were carried out  
27 on foot and by boat, and field camps were established  
28 for longer term site specific studies in remote areas.  
29 Each report in the Biological Report Series presents  
30 the specific methods, techniques and experimental  
design employed for the individual study. Major logistic

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
In Chief.

1  
2 bases were Old Crow, Arctic Village and various com-  
3 munities along the Mackenzie Valley.

4 Major groups have been sepa-  
5 rately studied, and intensive studies have been carried  
6 out on important species representative of major  
7 taxonomic groups. These are microtine rodents, large  
8 carnivores, aquatic and terrestrial fur-bearers and  
9 ungulates. Specific studies were not conducted on  
10 species such as otter or wolverine either because of  
11 their low numbers or widespread distribution within  
12 the study area, or because potential impacts were con-  
13 sidered to be negligible or non-existent. Studies on  
14 microtine rodents were conducted to investigate a group  
15 of mammals fundamental within the food chain. In  
16 addition, studies were designed to detect possible  
17 subtle habitat disturbance factors influencing micro-  
18 tine rodents.

19 THE COMMISSIONER: Excuse me  
20 Dr. Jakimchuk. What does microtine mean?

21 A Essentially it is a classi-  
22 fication that refers to mice and voles, voles being  
23 mice with very short tails generally.

24 THE COMMISSIONER: Yes.

25 WITNESS JAKIMCHUK: The latter  
26 studies stressed the ecological significance of the  
27 group rather than concern for individual populations of  
28 microtines. In general, the level of generalization of  
29 studies carried out reflects the ecological sensitivity  
30 of the species or their social, economic or aesthetic

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
In Chief.

1  
2 importance.

3                   The first major study initiated  
4 concerned the Porcupine Caribou herd, commencing in  
5 March, 1971. This is the largest herd in the western  
6 Arctic of Canada, and is an important resource from an  
7 ecological standpoint since caribou are one of the  
8 dominant herbivores in the Arctic ecosystem. In  
9 addition, caribou are an important resource to native  
10 peoples and aesthetically important because of their  
11 large numbers. Furthermore, the Porcupine herd ranges  
12 over very wide areas and could come in contact with  
13 potential industrial development.

14                   Our initial objectives in  
15 studying the Porcupine Caribou herd were to obtain  
16 information on the population dynamics, seasonal dis-  
17 tribution and movement patterns, and behaviour; es-  
18 pecially in relation to man-induced disturbances. The  
19 ultimate goal was to assess the nature, duration and  
20 significance of potential impacts. In addition, studies  
21 were designed to enable recommendations with regard to  
22 location, scheduling, design and operation and main-  
23 tenance of the pipeline in order to avoid or minimize  
24 potential impact.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 We set out to establish  
2 sufficient information about the populations so that  
3 we could assess if there were potential conflicts with  
4 the pipeline; and if that were the case, to determine  
5 the importance of the conflict and how it could be  
6 resolved. We assumed there was going to be an inter-  
7 action, however we did not know the parameters of that  
8 interaction until we had sufficient baseline information  
9 on the caribou population.

10 Our studies have been one of  
11 the most intensive studies of caribou distribution ever  
12 carried out.

13 I would just like to now read  
14 very briefly some of the titles, short forms of  
15 titles of reports that appear in the Biological Report  
16 series on our mammal studies which will indicate the  
17 range of studies carried out.

18 On caribou we have a study of  
19 the Porcupine caribou herd in 1971. Distribution of  
20 movements of the Porcupine caribou herd in the Yukon,  
21 1972. Distribution of movements of the Porcupine  
22 caribou herd in North-eastern Alaska, 1972. Distri-  
23 bution of movements of the herd in the Yukon, 1973.  
24 The same in north-eastern Alaska, 1974. Distribution  
25 and movements of the Porcupine herd in north-eastern  
26 Alaska and the Yukon Territory, 1974. And a report  
27 on the Kutchin caribou fences of north-eastern Alaska  
28 and the Northern Yukon Territory.

29 On other ungulate species we  
30 have reports on distribution of moose, muskox, and sheep

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 in north-eastern Alaska; observations of moose in the  
2 Northern Yukon Territory and Mackenzie River Valley;  
3 distribution of Dall sheep in the Mount Goodenough  
4 area, Northwest Territories; moose in mammal studies  
5 in north-eastern Alaska with emphasis within the  
6 Canning River drainage; Dall sheep in the foregoing  
7 report; population surveys of ungulates in a report  
8 on surveys of mammals along the proposed gas pipeline  
9 in Alberta; distribution and numbers of muskoxen in  
10 North-eastern Alaska and the Northern Yukon, 1973.

11 On furbearers and small  
12 mammals we have a study of furbearing mammals  
13 associated with gas pipeline routes in Alaska; a  
14 study of furbearers associated with proposed pipeline  
15 routes in the Yukon Territory and Mackenzie River  
16 Valley, 1971; Arctic fox on North Slope of the Yukon  
17 Territory, 1972; Beaver studies in the Mackenzie Valley,  
18 1972; a study of marten in the Mackenzie District,  
19 Northwest Territories; muskrat studies on Old Crow  
20 Flats in the Yukon Territory, 1972; wolf, wolverine and  
21 red fox within an overall report on mammal studies in  
22 North-eastern Alaska; population surveys of small  
23 mammals in surveys of mammals along the proposed gas  
24 pipeline in Alberta; population surveys of terrestrial  
25 furbearers in that latter report as well; population  
26 surveys of beaver in the Alberta volume; a study of  
27 the ecology of small mammals near Chick Lake that has  
28 been carried out in 1972, 3 and 4; a study of fur-  
29 bearers with particular reference to marten at  
30 Chick Lake, 1974.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

On large carnivores -- and I will point out right now that in one of these reports we presented data on moose, which is not a large carnivore, it's an ungulate, so bear that in mind. Under this heading, however, we have observations of moose, wolf and grizzly bear in the Northern Yukon Territory, '72 and '73; observations of grizzly bear in the Northern Yukon Territory and Mackenzie River Valley, '72; grizzly bear in mammal studies in North-eastern Alaska with emphasis within the Canning River drainage; the home range and population dynamics of grizzly bears in the eastern Brooks Range, 1974; Environmental considerations for the polar bears of the Beaufort Sea, 1974; Removal of radio-collars from grizzly bears in the eastern Brooks Range, 1975; polar bear den survey, 1975; home range and population dynamics of grizzly bears in the eastern Brooks Range, 1975.

In addition to these studies I've described, we have carried out a number of disturbance studies. These are what I previously referred to as the experimental or problem-solving type studies. These include:

1. A study of the reaction of caribou and Dall sheep to the simulated sound of a compressor station.
2. A study of the response of caribou to cutlines encountered during winter and spring migration.
3. A study of the reaction of caribou, moose and grizzly bear to aircraft disturbance.
4. Reactions of caribou to man-made objects.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

5. A study on the effects of seismic lines on small mammal populations near Fort Simpson, Northwest Territories.
6. The reaction of barren ground caribou to aircraft in a report on the reaction of some mammals to aircraft and compressor station noise disturbance.
7. The effects of simulated compressor station sound on Dall sheep using mineral licks in the Brooks Range, Alaska.
8. And finally, the reaction of Dall sheep to an FH-1100 helicopter in that latter report.

The scope and range of studies conducted is documented in the preceding list. It is my opinion that these studies have formed an adequate basis for assessing the proposed development, probable impacts, and establishing mitigative measures.

It is noteworthy that studies reflect a wide range of ecological investigation. These range from fundamental baseline studies, studies of disturbance to minor species important as converters within the food chain; studies of behavioural characteristics and experimental disturbance studies. Attention has been devoted to species such as marten and beaver as well as the more visible and glamorous species such as Dall sheep and caribou. This is consistent with our goal to investigate the widest possible range of impact of the pipeline on mammals.

As a consequence, it is my opinion that the studies undertaken are both adequate, and address with specific data the concerns that have

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 been raised before this Inquiry and that they have  
2 met the requirements of the applicable N.E.B. regulations  
3 and that insofar as my discipline is concerned, the  
4 pipeline can be built within the requirements of the  
5 DINAD Northern Pipeline Guidelines.

6 Our impact assessment is  
7 based upon the present proposal, design, and assumptions  
8 that revegetation will proceed as described by Mr. Dabbs.

9 Environmental input. We  
10 formally commenced working on routing recommendations  
11 starting in early 1972 with systematic review of align-  
12 ment sheets. Prior to that recommendations were made  
13 in reports or informally, such as through phone calls.

14 A procedure was established  
15 whereby Renewable Resources regularly received for  
16 comment copies of alignment sheets and drafts of  
17 the exhibits dealing with construction procedures.

18 We also participated in  
19 meetings and discussions with the engineers, including  
20 that held during the week of April 9th to 13th, 1973,  
21 should be added there.

22 Our fundamental recommendation  
23 was for a coastal route in Alaska and the Northern  
24 Yukon. This recommendation was based primarily on  
25 avoidance of interactions with the caribou population,  
26 and other species such as Dall sheep. It is also based  
27 on avoiding habitats of furbearing species which were  
28 considered to be of greater significance on the interior  
29 route than the coastal route. Our recommendation was  
30 based upon the assumption that construction would be

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 during the period of migration and when the largest  
2 portion of the herd is on the winter range to the south.

3 There appears to be an error  
4 there. Yes, there is an omission, a typewritten  
5 omission. I repeat, our recommendation was based upon  
6 the assumption that construction would be completed by  
7 the time of migration, and would take place when the  
8 largest portion of the herd is on the winter range  
9 to the south.

10 As far as caribou are con-  
11 cerned, winter construction on the coastal route would  
12 preclude interactions during the migration period and  
13 the calving period. The coastal route does go through  
14 the calving grounds, however pipeline construction is  
15 scheduled for completion prior to the time calving  
16 or migration would take place. There is a greater  
17 possibility for an interaction on the interior route  
18 with caribou. Most of the population, for example,  
19 winters south of either of the pipeline routes but  
20 the wintering range is closer to the interior route.

21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1  
2 The interior route also is  
3 closer to Old Crow Flats, an ecologically important  
4 area. A further reason for not recommending the  
5 interior route is that it travels through the Canning  
6 River Valley in Alaska which is perhaps the most  
7 productive wildlife area along the entire routing in  
8 Northern Canada and Alaska.

9 The coastal area is used for  
10 foraging by grizzlies during the summer period. However  
11 one of the advantages of the coastal route is that  
12 during winter construction most of the bears would be  
13 inland in dens, so that there would not be a direct  
14 interaction during the construction time. During  
15 compressor station construction in the summer, inter-  
16 actions could occur with the bears being attracted to  
17 an area of human activity.

18 Interaction with the most  
19 important Arctic fox denning habitat is avoided on the  
20 coastal route. During winter construction the only  
21 other mammal interactions may include small numbers of  
22 caribou which are sometimes found on the coastal plain  
23 and a population of muskox in Alaska consisting of  
24 30 to 40 animals in total. There would be interaction  
25 of negligible significance on small mammals, such as  
26 microtine rodents, but these would be unavoidable in  
27 any pipeline routing. I should point out also that the  
28 prime route as it swings south along the west side  
29 of the Mackenzie Delta passes within one mile of a Dall  
30 sheep range in the vicinity of Mount Goodenough. This

Banfield, Dabbs, Gunn  
Hemstock, McC art, Jakimchuk  
In Chief

1 was raised by the Pipeline Application Assessment  
2 Group. I feel that during construction activities  
3 some displacement of sheep may occur from the extremi-  
4 ties of range nearest the pipeline. It is, however,  
5 unknown and impossible to predict if this will be the  
6 case and how many animals might be affected. My opinion  
7 is that only a minor segment of the population might  
8 be affected. I do not think there is a likelihood of a  
9 mass exodus from winter range. Factors which lead me  
10 to this opinion are:

11 1. While the map distance to the edge of the range  
12 to the route is approximately one mile, there are  
13 buffers such as wooded slopes and steep topography  
14 between the construction area and the winter range.  
15 Sheep occupy the higher elevations during winter.  
16 Associated slopes at higher elevations, draws and  
17 plateaus also provide both a visual and noise buffer  
18 between the wintering sheep and the pipeline.

19 2. Existing and past hunting practices involve  
20 pursuit of sheep by snow machines. This pursuit is  
21 directed specifically at the sheep and results in  
22 direct mortality. I consider this type of activity  
23 more disturbing than a passive noise disturbance. The  
24 fact that sheep still occupy the winter range indicates  
25 that they have either habituated to disturbance to  
26 some degree or have altered their winter range prior to  
27 any existing studies.

28 If faced with a choice of  
29 potential construction disturbance, I would favor  
30 avoiding the lambing period, during May to mid-June.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 Present scheduling of construction would avoid this  
2 period.

3 I would add that I agree  
4 with the Assessment Group's suggestion that construction  
5 on the segment of the line near the winter range take  
6 place in early rather than late winter as an additional  
7 precaution.

8 Q Mr. Jakimchuk, just  
9 before leaving this point, I realize we'll get into  
10 this later but I wonder if you just might comment  
11 about the effect the cross-delta route would have inso-  
12 far as the Dall sheep near Mt. Goodenough are  
13 concerned?

14 A Well, with the cross-  
15 delta routing, as a matter of fact that whole section  
16 becomes quite redundant because it by-passes that  
17 sheep population by 40 or more miles and that then  
18 becomes -- there is no longer any concern of even a  
19 peripheral interaction.

20 Q Thank you.

21 A Potential interactions  
22 with caribou. The calving period is from late May  
23 through mid-June. Winter construction activities  
24 in the calving area will be completed by May 1st,  
25 therefore there will be no direct interaction with the  
26 calving herd because of the construction schedule.  
27 Summer construction is proposed for compressor stations  
28 however strict measures are designated in the  
29 application to avoid aircraft overflights, vehicular  
30 interference, and other construction activities within

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 the calving ground during the calving period.

2 Strict protection should be  
3 given the calving herd at this time in addition to  
4 measures to avoid interference with the movements of  
5 the post-calving aggregations.

6 From the intensive studies  
7 of the Porcupine herd over the last four years we  
8 have established that there is a general consistency  
9 in their annual cycle. This does not mean, however,  
10 that the population is precisely predictable. Variations  
11 have occurred in movement patterns, distribution and  
12 timing of movements in response to natural environmental  
13 conditions. The type of environmental changes I  
14 refer to are such factors as snow depth, temperature  
15 conditions, time of spring breakup on rivers which are  
16 crossed in migration and existing human activities with-  
17 in the range of the herd.

18 We have also documented  
19 variations in the extent of the calving ground. However,  
20 the variations which have occurred have not impaired  
21 the productivity of the population. This indicates  
22 that the caribou are able to adapt to environmental ch-  
23 anges and conditions and still maintain their basic  
24 cycle and productivity.

25 Routing recommendations.

26 In 1972 we were asked our opinion on routing on the  
27 east or west side of the Mackenzie River Valley.

28 It was difficult to ascertain  
29 which would be better from the standpoint of mammals,  
30 however, we tended to favor the east side rather than

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 the west because we have documented important habitat  
2 particularly for aquatic furbearers on the west side.  
3 Two such major areas were the Ontaratue and Ramparts  
4 River Deltas on the west side of the river.

5 We also proposed a major  
6 change in the vicinity of Travaillant Lake during  
7 our 1973 review meetings. This is with respect to what  
8 was then known as the Richards Island lateral. The al-  
9 ignment as it existed, went through an area important  
10 for trapping and for the production of furbearing  
11 mammals and birds. As a result, there was a major  
12 change made in the routing to avoid what was considered  
13 to be an environmentally sensitive area.

14 We have also examined the  
15 Fort Simpson realignment during 1974 and 1975. We  
16 feel that this realignment is not materially different  
17 than the original routing, and is an acceptable rout-  
18 ing with respect to mammals.

19 From our first year of  
20 involvement in the project we made recommendations to  
21 avoid sensitive or critical areas and during the April  
22 '73 review meeting numerous minor alignment changes  
23 were recommended, many of which were implemented.

24 Scheduling. Scheduling of  
25 construction is a vital consideration in avoiding  
26 conflicts with mammals; particularly caribou. We  
27 have made numerous recommendations on scheduling. Some  
28 of them have been very specific in that they refer to  
29 particular mountain passes. Other scheduling recommen-  
30 dations are general, and referred to acceptable

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 construction periods within a geographic area. The  
2 decision to carry out winter construction which was  
3 made for both engineering and environmental reasons,  
4 has the result of avoiding many interactions between  
5 construction activities and mammals. These recommenda-  
6 tions have been re-evaluated and refined as additional  
7 data from our research was obtained each year.

8 Other recommendations. From  
9 an early stage in our research we raised concerns re-  
10 garding alteration of the downslope hydrological regime  
11 in permafrost areas. This was a general environmental  
12 concern related to possible effects on habitat. We dis-  
13 cussed this several times with the engineers and hydrolo-  
14 gists. The current design for ditch blocks to avoid  
15 ponding along the line and a granular crown in  
16 potential problem drainage areas is, in part, I feel,  
17 a response to the concerns we raised early in our  
18 studies.

19 We have made specific recommen-  
20 dations for most species, whether or not they are con-  
21 sidered rare and endangered. This is because there  
22 is a variance between what is considered rare and en-  
23 dangered according to the source. We feel, however,  
24 the protective measures should apply irrespective of the  
25 official status of mammal species and have made recommen-  
26 dations accordingly.

27 For example, we have made  
28 specific recommendations to avoid any physical alterations  
29 of den sites for Arctic fox and grizzly bear. We have  
30 set altitudinal guidelines to avoid aircraft harassment

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 of caribou, barren ground grizzly bears, moose and  
2 Dall sheep. We have recommended operational and  
3 policy procedures to avoid killing of animals through  
4 shooting or trapping. This is particularly important  
5 in the case of bears since conflicts between man and  
6 bears often result in unnecessary destruction of bears.  
7 We have recommended fencing of compressor station  
8 sites and airstrips at strategic locations to avoid  
9 conflicts with caribou and grizzly bears.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

The recommendations made appear in the environmental exhibits as policy and in segments of the design, operational and construction exhibits.

Specific recommendations to avoid aircraft harassment and other disturbances to mammals based on limits established by our research appear in the application as protective measures to be followed by the Applicant.

In conclusion, it is my opinion that the pipeline as proposed will not have major adverse impacts on mammal populations and that the impacts anticipated will be local and minor.

MR. MARSHALL: Sir, Mr. Jakimchuk also has some slides that he wishes to present and in addition, the paper that was distributed the other day. And I will ask Mr. Jakimchuk to present these slides. Do you wish to do these slides now?

A Well, I actually I should probably read this and then show the slides.

THE COMMISSIONER: Fine. Whatever you think, sir. Do you have a copy, sir.

A Yes.

First, a word of explanation. I have been following the proceedings with a great deal of interest and the testimony of other witnesses and as a result of that, I have prepared an analysis related specifically to the Porcupine Caribou herd.

THE COMMISSIONER: When you say

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

you have followed the evidence of the witnesses, we had the evidence of Dr. McTaggart-Cowan and we saw the evidence of Dr. Banfield, Dr. Geist and perhaps Dr. Weedon as well touched on the herd.

A That's correct.

Q Is there anybody else?

A Not specifically that I can think of.

The purpose of this in as much as I have arrive at some conclusions and recommendations, I think the primary purpose of this presentation is to put forward the process by which I arrived at these. The rationale for reaching the conclusions.

I regret if some of it may seem redundant to what I said previously but I will go through this and follow it up with some slides.

Q All right.

A A great deal of attention and concern has been focused on the Porcupine Caribou herd in the regulatory process regarding the proposed Arctic Gas pipeline. This is both understandable and proper because of the importance of this resource, economically, ecologically, and aesthetically in the United States and Canada.

Underlying the general concern and articulation of possible impacts are two questions:

1. What is the likely

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

impact and where are the dangers?

2. Which routing is more  
(or less) desirable or prudent from the point of view  
of the caribou population?

Testimonies presented to  
date intimate a serious impact on the herd. Testimon-  
ies referring to extirpation of caribou in the Mackenzie  
Balley by Dr. Cowan inferred that extirpation may be a  
consequence of pipeline development, although depletion  
was the stated prediction for the Porcupine herd.

However, in testimonies  
to date, no clear preference has been advanced for a  
routing with respect to caribou. The government  
assessment report has indicated, however, a clear pre-  
ference for the interior route with respect to mammals  
considering the Canadian environment only.

In this presentation, I  
would like to address the question of impacts on  
caribou, then the question of the coastal versus the  
interior route with respect to the Porcupine herd.

Very detailed information  
has been obtained on the distribution and movements of  
the herd over the past four years. (For further  
information, refer to Volumes 4, 7, 22, and 32 of the  
Biological Report Series.)

In addition, disturbance  
studies have provided quantitative data on responses  
to various types of disturbance during the regulatory  
process. (Volumes 5 and 23 of the Report Series.)

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 Most concern has been focused on:

2 1. Disturbance initiated  
3 mortality.

4 2. Interruption of  
5 migrations (the barrier potential).

6 3. Interference with  
7 calving and post-calving activities.

8 Loss of habitat has not  
9 been considered as a serious concern because the 120  
10 ft. right-of-way represents a minute habitat loss when  
11 the 100,000 square miles of range of the herd is  
12 considered.

13 The areas of concern  
14 mentioned have been researched from 1971 to the  
15 present and the results have been presented in the Biol-  
16 ogical Report Series. It has been generally acknowledged  
17 by those who have reviewed our reports that the Appli-  
18 cant has done detailed work on distribution and  
19 movements. However, the experimental studies conducted  
20 have received little mention. These studies indicate  
21 a very early effort to test, in the field, many of the  
22 hypotheses and concerns of the consultants, concerns  
23 which have subsequently been articulated at these  
24 hearings. I emphasize that the experimental field  
25 studies carried out were both innovative and pioneer  
26 studies in testing possible impact factors ranging  
27 from deflection of caribou from a cleared right-of-way  
28 to the effects of compressor station noise in calving  
29 areas. Of all the agencies involved in assessing this  
30 project, only the Applicant has conducted experimental

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 studies, not only on caribou but on other species  
2 as well. This is of paramount importance, since these  
3 studies provide a scientific basis on which to assess  
4 concerns and refine the speculative hypothesis into  
5 a probability analysis.

6 The Applicant's studies  
7 have done more than just define distribution and  
8 abundance -- the primary phase common to most wildlife  
9 investigations. In the course of studies, biological  
10 characteristics and behavioural attributes have been  
11 dealt with. Thus, one can frame a conceptual scenario  
12 in concert with other literature against actual data,  
13 rather than a conceptual scenario against theory alone.

14 This is the singular  
15 attribute of the Applicant's studies which gives  
16 credence to the conclusions drawn and provides a data  
17 base for the conclusions.

18 Some interesting findings  
19 of the studies provide examples of the range of subject  
20 considered. For example:

21 1. Over a four-year  
22 period, the peak of calving has been between June 5 and  
23 7 -- a remarkable consistency.

24 2. The post-calving  
25 aggregation -- the coming together of the whole herd --  
26 has occurred within a 10 day period over four years.

27 3. The re-entry into  
28 Canada on post-calving movements has occurred within  
29 the same general routes and time frame over a 4 year  
30 period.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

4. Caribou encountering  
a cleared seismic line or winter road will not be  
deflected if the angle of approach is greater than 45°.

5. Winter roads with  
prior vehicular travel are preferentially utilized by  
caribou.

6. Caribou fences  
(of aboriginal origin) along summer movement routes  
provide evidence of long-term tradition in the  
movement cycle.

7. Snow barriers can  
create differential spring migration timing in the  
northern Yukon.

In order to define the  
critical elements to the survival of caribou, one has  
to look at their behavioural adaptations within their  
lifetime (which is referred to as ontogenic attributes)  
and in the evolutionary timeframe (where they are  
phylogenetic development).

Many adaptations are  
readily apparent, while others are more obscure.  
However, the range of adaptations include behavioural,  
morphological and physiological factors.

Thus, we can readily  
determine that migration, herding, dispersals and  
calving are adaptations which in some way have evolved  
to enable survival in a harsh environment. These are  
traditional and phylogenetic in origin. Structural  
adaptations enable caribou to survive and prosper in

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

a particular set of environmental circumstances.

Examples are: Hooves adapted for travel over soft terrains, and for cratering in snow -- the adaptation to a predominantly nival existence. Hollow pelage provides both efficient insulation from cold and buoyancy for the frequent swimming done in the course of annual movements.

Physiological adaptations enable caribou to withstand extreme cold, and to ingest an extremely wide range of forage -- changing drastically with the seasons.

Behavioral adaptations include responses to predators, insect harassment, and to physical environmental conditions. These, also are numerous and extremely varied. In essence, however one can conclude that behavioral adaptation is a mechanism which places the animals, or the species in the most favorable position for survival at a given time or under a given circumstance.

Thus, while caribou are closely tied to a calving range, their utilization of winter range is more variable, depending on snow conditions. They display, within an overall traditional behavior, sufficient elasticity in their behavior to overcome most short-term environmental contingencies such as: unfavorable snow conditions on winter range, natural barriers such as rivers and mountain ranges, extreme cold and response to danger. The <sup>almost</sup> constant movement of caribou throughout this annual cycle pre-

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

cludes over-utilization of range, where the growth rates of forage are slow and productivity per unit area is low.

When one examines all of these factors we find that caribou have certain attributes which enable them to survive. What then are the weakest points in this chain of survival? What is the most tangible manifestation of a caribou meeting its need for survival? One answer is the migration and mobility of the species. Another is their reproductive potential, that is, the ability to overcome mortality from hunting, death by natural causes and predation. Another is their ability not only to bear young but to have the young survive to maturity. Which of these factors is the over-riding consideration in terms of human disturbance, and more particularly in terms of the pipeline proposal?

Let us now look more specifically at some of the key elements of the life cycle concerning the Porcupine caribou herd.

And I'd just add in here that I have tried to make this very brief in terms of the life cycle elements. So you may have some further questions on them.

Migration -- The major purposes for the long annual migrations of caribou are as follows:

(1) It enables them to utilize range most effectively without over-utilization.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

(2) It places them in  
the most favorable energy balance potential at  
various times of the year.

(3) It enables them  
to bear and rear young on the most favorable habitat.

In Chief.

A That's correct. I have a couple of overhead slides which will show the distribution over the past four years, but generally one could consider the calving grounds from the Babbage River west to the Canning River in Alaska. In some years the bulk of the population may calf in Alaska. In other years, portions calf on the Yukon side.

Its purpose is unclear but  
it may serve to bring the whole herd together in

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 maintenance of the herd traditions, maybe the stimulus  
3 for summer movements, protection from insect harassment  
4 or even to ensure genetic mixing of the herd components.  
5 The aggregation is the only time of the year the entire  
6 population interacts as a single unit.

7 SUMMER MOVEMENTS

8 At this time, the herd moves  
9 as a single unit, then splits up and follows a tradi-  
10 tional path over summer range. The destructive capa-  
11 bilities of tens of thousands of animals on the terrain  
12 is readily seen at this time. These movements are  
13 characterized by large groups eventually splitting into  
14 smaller and smaller groups. Summer movements appear to  
15 function as a way of distributing caribou evenly over  
16 the summer range, and as a mechanism to avoid insect  
17 harassment.

18 THE AUGUST DISPERSAL

19 No longer are the large herds  
20 present but caribou are dotted over the landscape of  
21 many thousands of square miles. They are more widely  
22 dispersed than at any time of the year. This is a  
23 vital time also since gains in weight and storage of  
24 fat provide energy for the migration and the forthcoming  
25 winter.

26 Animals which are thin and  
27 rangy in June and July are sleek and fat by the end of  
28 August, a remarkable transition. Thus, the dispersal  
29 is also a vital mechanism which distributes grazing  
30 pressure and precludes competition of available forage

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 resulting in the fastest possible accumulation of fat  
3 and long-term maintenance of the range.

4 THE FALL MIGRATION

5 Once again larger and larger  
6 aggregations form which eventually culminate in a  
7 directed movement to winter range, often triggered by  
8 a severe storm. Breeding may take place during or  
9 immediately following the migration, depending on its  
10 chronology in a particular year.

11 WINTER RANGE

12 Here caribou maintain them-  
13 selves during the long, dark winter. They are loosely  
14 aggregated and constantly making random movements within  
15 the vast area of winter range seeking out lichens and  
16 soft, shallow snow cover in the taiga where craters may  
17 be dug with a minimum of energy expenditure. Areas  
18 are sought where movement is unimpeded either by deep  
19 snow or crusted conditions such as are found in untreed  
20 windswept areas. When extrinsic environmental conditions  
21 are favorable, caribou again display elasticity in  
22 behavior. Examples are, wintering on portions of the  
23 North Slope and the Old Crow Flats during winters of  
24 minimal snowfall. And as you will see from slides  
25 overhead later, there has been some wintering in the  
26 northern areas in the last two years, including the  
27 Slope.

28 MR. MARSHALL: Just on that  
29 point, approximately what numbers would be involved?

30 A Last year, I believe, it

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 was approximately 5,000 out of the herd of 110 to 115  
3 thousand, the year before last. And last year it could  
4 have been up to 10% of the herd, up to 10%.

5 THE COMMISSIONER: Wintering  
6 on the coast?

7 A Yes. Throughout this  
8 annual cycle, calves which survive to yearlings are  
9 replacements to the herd and, depending on this survival  
10 rate, the herd will decrease, remain relatively static,  
11 or increase in total numbers. It is characteristic  
12 of caribou populations that recruitment to the herd is  
13 generally low. This may be generally attributed to the  
14 high calf mortality owing to predation and accidents.  
15 Adult caribou are also lost to the herd by predation,  
16 accidents, hunting and old age. Caribou generally do  
17 not experience explosive growth rates because of these  
18 factors.

19 One then can consider an impact  
20 to be major if factors operate to reduce the herd beyond  
21 its level to replenish itself with the annual increment  
22 necessary to maintain the population. That is, any  
23 mortality or a change in productivity, direct or induced  
24 which exceeds the reproductive capability of the herd.  
25 This then would be the measure of impact and the  
26 distinction between a severe, major impact and a minor  
27 impact.

28 In an impact analysis, there-  
29 fore factors should be examined which could change the  
30 total recruitment to the herd.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

These factors are:

- Depletion of range.
- Direct killing by hunting, vehicles.
- Harassment.
- Interruption of traditional behavior with secondary effects leading to mortality.
- Interference with productivity (calving or calf survival).

Of all the factors presented and considering the elements of the annual cycle, the ramifications of pipeline routing, construction and operation should now be considered:

- Removal of range directly by a right-of-way is considered insignificant by all assessments made.
- Direct killing is a function of access but a controllable variable through regulation. The access provided by a pipeline right-of-way is variable and seasonal, but to a large extent a controllable factor, for example, sport hunting would not occur during summer and airstrip utilization during winter could be controlled. The lack of a permanent road is a significant mitigating factor with respect to access.
- Killing by collisions with vehicles during winter construction on the coastal route is unlikely.

. At the most a small percentage of the herd have been recorded wintering in this area. Wintering may not occur at all in this area, since the usual winter range is the forested taiga.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

During the winter animals are generally dispersed, they are non-migratory at this time. Vehicular travel will not be high-speed and avoidance of collision is possible by the actions of both the vehicle operator and evasion by the caribou themselves.

#### HARASSMENT

This subject has been well discussed in depth during the regulatory proceedings. Specific protective guidelines based on research data have been established by Renewable Resources for the applicant. For example, measures will be employed to avoid activity in the calving ground entirely during the calving period.

#### INTERRUPTION OF TRADITIONAL BEHAVIOR

Studies of the Porcupine herd, other caribou herds and a conceptual analysis of caribou evolutionary adaptations lead to the conclusion that migratory movements are vital adaptations to the maintenance and survival of caribou. They allow caribou to exist, reproduce and perpetuate within rigorous climatic constraints and in habitat of low general productivity. Interruption of migrations has direct and indirect implications, many of which may be unforeseen. These include the spring and fall migrations and summer movements and utilization of calving range.

Historically, records show a high mortality of calves where migration to the calving grounds has been impeded and blocked by deep snow. Other implications are possible changes in patterns of range

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 use, both summer and winter, and changes in synchrony  
3 of movements all of which have the potential for major  
4 effects on productivity during the longer term if  
5 evolutionary traditions are altered. That is, a short-  
6 term change in patterns would preclude learning pro-  
7 cesses of calves and yearlings thus progressively  
8 altering traditional patterns.

9 Therefore, I have concluded  
10 that the migratory periods are the most vital elements  
11 in the life cycle of barren ground caribou, the weakest  
12 link in the chain. The spring migration includes pregnant  
13 cows who must reach calving grounds to successfully calve  
14 and meet vital nutritional requirements. The summer  
15 movements appear to be important in range utilization  
16 and energy buildup. The fall migrations lead caribou  
17 to winter range and shelter requirements. The post-  
18 calving aggregation is undoubtedly an extremely im-  
19 portant event though its function is not full under-  
20 stood.

#### 21 INTERFERENCE WITH PRODUCTIVITY

22 Calving and post-calving  
23 periods are very important and the characteristics of  
24 calving have been previously described. It occurs over  
25 an approximately 4,000 square mile area, with the  
26 density of the calving herd becoming progressively  
27 greater following the peak of calving to the formation  
28 of the post-calving aggregation.

29 Strict avoidance of disturbance  
30 during and following calving is a necessary precaution

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 despite the fact that disturbances such as aircraft  
3 would only involve a small portion of the calving  
4 population at any given location. It is important  
5 to note that the calving herd is not in fact a herd but  
6 a loosely distributed continuum, so that a disturbing  
7 factor would not affect the entire herd as a unit.

1 Since winter construction  
2 will preclude an interaction with calving, what will  
3 be the effect of a coastal routing across the calving  
4 ground?

5 The calving ground is the  
6 terminus of the spring migration, and of all movements,  
7 the arrival of caribou in the area is the most predi-  
8 ctable and consistent event in their movement cycle.

9 It should also be mentioned  
10 that the main segment of the calving area occurs south  
11 of the coastal actual routing, but the entire area to  
12 of the Beaufort Sea  
the coast/may be considered a potential calving area.

13 The effect of a buried pipeline  
14 built in the area in winter would be a low mound of  
15 spoil material along a disturbed right-of-way. No  
16 activity would be under way during the calving period.  
17 The right-of-way would not form an impediment to movement  
18 and in any event, as Dr. Cowan has noted in his testi-  
19 mony, most migratory movement on the coast prior to  
20 calving is parallel to the right-of-way.

21 In time, caribou would encoun-  
22 ter compressor stations. However, studies undertaken by  
23 Renewable Resources for the applicant have ascer-  
24 tained that the noise is an insignificant disturbance  
25 to caribou and does not affect their behaviour or  
26 movements. Dr. Geist has referred to the well-known  
27 principle of ungulate adaptation to disturbances which  
28 are continuous and not associated with a harmful  
29 experience. At spacings of approximately 50 miles,  
30 stations are not expected to have either short or long-

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 term detrimental effects. Thus calving would proceed  
2 uninterrupted by construction activity, or aircraft  
3 flights. During the post-calving period any activity  
4 would be limited to the compressor sites and regulations  
5 regarding harassment of caribou would be in force.

6 We now know enough of the  
7 location of the post-calving aggregation, the period  
8 of its occurrence (July 3 to July 10, in general, I  
9 would add there, we have just recently recorded some  
10 variation there) and its duration, three to four  
11 days to prohibit any/potentially disturbing activity  
12 at that time in that area.

13 By July 10th to 20th most  
14 of the Porcupine herd have left the North Slope and  
15 are south of the sphere of influence of the pipeline.

16 In the case of the Porcupine  
17 herd, elasticity in the calving area has been  
18 documented indicating an adaptive capability to  
19 respond to environmental conditions. For example, rivers  
20 in flood present crossing barriers to cows with calves,  
21 and are not crossed until waters drop or calves are  
22 sufficiently strong to negotiate the crossings.

23 Population declines. Declines  
24 have been most often postulated as a result of hunting  
25 and predation, and by some workers, caribou researchers,  
26 loss of range to forest fire -- but that is a subject  
27 of debate within the literature. The only declines  
28 attributed to human developments relate to interferences  
29 with migratory movements. Vehicular movement on  
30 highways and railroads in particular serve as barriers

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 to movement, and as a source of hunting mortality  
2 provided by access. The decline of the Nelchina herd  
3 in Alaska is a case in point.

4 THE COMMISSIONER: That isn't  
5 the 40-mile herd?

6 A No, it's a different  
7 herd. Dr. Klein of the University of Alaska has  
8 written a paper on the effects of human development  
9 on reindeer in Scandanavia and in each case the  
10 interruption of the migratory movement is the factor  
11 involved in the decline or disruption of caribou  
12 behaviour.

13 Thus from the preceding analysis  
14 and the literature, I feel very confident in concluding  
15 that the pre-eminent and most vulnerable element of the  
16 life cycle consists of the migratory movements and their  
17 associated behaviour. In summary, I would like to  
18 quote from a 1971 paper by Dr. Bergerud, the paper has been  
19 published in the publication,

20 "The role of the environment in the aggregation  
21 movement and disturbance of caribou,"  
22 delivered at a symposium in Calgary. I think Dr.  
23 Bergerud has some very interesting things to say so  
24 I'll read this verbatim, quoting:

25 "The seriousness of human disturbance should be  
26 considered in the light of the perceptive and  
27 escape adaptations caribou have evolved in  
28 association with wolves. For example, a road  
29 or a building are not factors that have been  
30 prior phylogenic contingencies. Caribou have

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 no adversion to roads or railroads in Newfound-  
2 land. These are just more open tundra to travel  
3 upon. Animals in Newfoundland even detour to  
4 be able to walk along roads. Further, the noise  
5 of a car is cause for only a temporary alert.  
6 However, the motion of a vehicle is a stimulus  
7 for flight. A road could be a barrier if the  
8 vehicle activity is such that strange moving  
9 objects are perceived continuously. Many  
10 caribou in Newfoundland cross the Trans-Canada  
11 Highway in the early morning hours prior to  
12 traffic. Airplanes again provide motion; the  
13 helicopter more so than fixed wing. Again  
14 caribou pay little heed to high flying planes  
15 when the noise is heard but the motion is not  
16 perceived.

17 Caribou are tolerant of civilization. The Avalon  
18 herd in Newfoundland uses ranges within one  
19 mile of a well-travelled highway. The Humber  
20 herd winters on ranges where cars and trains  
21 are heard daily. Caribou in Gaspé Peninsula,  
22 Quebec, feed in the winter on arboreal lichens  
23 on trees recently cut by loggers. The behaviour  
24 of barren ground caribou crossing roads and  
25 railroads and even passing through communities  
26 is well-documented.

27 The use by caribou of open habitats plus their  
28 gregarious herd structure and inability to per-  
29 ceive motionless objects makes them extremely  
30 vulnerable to hunting. Caribou probably often do

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 not live near man because adjacent populations  
2 have been over-exploited. Phylogenically there  
3 appears little aversion to man - caribou can  
4 live near man if we permit it.

5 Caribou are wilderness animals in one sense;  
6 large herds need vast areas to wander in. The  
7 gregarious herd structure superimposed on the  
8 slow-growing fragile Arctic flora requires  
9 continuous wandering. This continual movement  
10 of caribou is perhaps their major adaptation  
11 to their extrinsic environment.

12 In summary,"

13 this is Dr. Bergerud again --

14 "...I suggest that the open habitat-wolf-caribou  
15 interaction has phylogenic consequences not  
16 liable to rapid modification. We might expect  
17 caribou to continue to be unwary towards man,  
18 gregarious and vulnerable to hunting as long as  
19 wolves are part of their environment and breed-  
20 ing populations are large. In situations in  
21 which food, insects or weather are important  
22 considerations in behaviour a plastic response  
23 might be expected. We might expect adaptive  
24 modification to human activities that affect  
25 these latter components of the natural environ-  
26 ment of caribou."

27 To conclude, I would like to  
28 discuss finally routing considerations. The fore-  
29 going discussion provides the basis for assessing route  
30 preferences with respect to caribou. Other species and

Sanfield, Dabbs, Gunn  
Hagstock, McCart, Jakimchuk  
In Chief

1 their habitats are also considerations from a  
2 mammalogical standpoint, however this comparison is  
3 based on caribou alone.

4 For the sake of brevity and  
5 in view of the preceding discussion, a point form  
6 comparison will be made of advantages and disadvantages  
7 of both routings. I'm talking now about the coastal  
8 versus the interior route. It is stressed that Alaska  
9 portions of the caribou range are included since these  
10 habitats are just as important as those in the Yukon  
11 to the welfare of the herd.

12 O.K., we'll look at the  
13 coastal route. Advantages:

- 14 1. Avoids major migratory movements.
- 15 2. Construction completed one month prior to arrival  
16 of caribou for calving.
- 17 3. Fall migration out of the area precedes winter  
18 construction by one to two months. We have to revise  
19 that comment to some degree to account for a small  
20 herd component that winters there.
- 21 4. Summer movements are south of the routing,  
22 generally south of the routing.
- 23 5. It avoids main winter ranges by 100 to 150 miles.
- 24 6. Is remote from existing hunting villages, except  
25 for Kaktovik in Alaska.
- 26 7. The construction schedule avoids the post-calving  
27 aggregation.

28 Those are the advantages I  
29 view of the coastal route.

30 The disadvantages are:

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1. The routing crosses the calving ground.
2. There will be compressor stations within the calving ground.
3. The post-calving aggregation occurs on the coast where there will be some summer activity.
4. Portions of the herd have been known to winter within portions of the coastal alignment.

The interior route has the following advantages:

1. It avoids the calving ground.
2. And it avoids the post-calving aggregation.

In terms of the disadvantages, the list I feel is much longer. The disadvantages of the interior route are:

1. It crosses the migratory paths of spring and fall migrations and summer movements.
  2. Year-round activity in the Canning River Valley in Alaska would interfere with movements during spring, fall and summer. I'm talking about year-round construction activity in that area.
  3. The routing crosses a major winter range in Alaska.
  4. It crosses winter range in the Richardson Mountains.
  5. It is within the northern periphery of a major central Yukon winter range.
  6. Access provided within the Canning Valley and within Alaska and within winter range for hunting.
- I'm referring now to the substantial amount of rock work that will be required-- would be required in that area that would actually provide permanent access roads, as opposed to a buried pipeline through soil.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 7. Migratory movements on the Richardson migration  
2 route, that's through the Richardson Mountains,  
3 occurred as early as March when winter construction  
4 would still be under way.

5 8. The Old Crow migration is avoided by a variable  
6 of only zero to two weeks within the proposed  
7 construction period.

8 9. Compressor stations would be located in migratory  
9 corridors.

10 10. And also, compressor stations and other facilities  
11 are often in confined areas, for example, river  
12 valleys.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 Now, I have not given  
3 any particular weight to those advantages and  
4 disadvantages. I want to point them out to you as my  
5 rationale.

6 The foregoing are not  
7 weighted according to possible mitigative measures  
8 or major changes in construction scheduling. My  
9 conclusion, however is preference for the coastal  
10 route in terms of the overall considerations presented,  
11 the construction plan, mitigative measures proposed and  
12 margin of avoiding interaction by construction  
13 scheduling. The latter point combined with  
14 unavoidable interference with caribou via the interior  
15 Canning River route are the most compelling reasons  
16 for these conclusions. Access is also a more significant  
17 factor on the interior route.

18 In summary my preference  
19 is based upon considerations of details of the ecology  
20 of the ecology of the Porcupine caribou herd and  
21 factors which may influence their productivity and popu-  
22 lation status in particular, the evolutionary importance  
23 of their traditional behavior and ramifications of the  
24 pipeline on these, and their adaptive potential.  
25 Potential secondary effects such as hunting provided  
26 by access and examples of caribou declines discussed  
27 in the literature where human development activity has  
28 been cited are also important factors in my conclusion.

29 I have also concluded that  
30 the pipeline, as proposed, will not impair the status

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 and I stress that "as proposed" -- will not impair the  
2 status of the caribou population. This development in  
3 itself will not exceed my major impact criterion:  
4 That is the ability of the herd to replace potential  
5 losses by its annual recruitment. It is in fact, my  
6 expectation, that actual losses or effects attributable  
7 to the pipeline both short- and long-term will be  
8 negligible.

9  
10 That concludes my  
11 fairly lengthy analysis of the routing considerations  
12 and impacts. I felt it was necessary to do so to  
13 give my rationale.

14 THE COMMISSIONER: Yes. Thank  
15 you, Mr. Jakimchuk. I think that since no one is here  
16 today from the Environment Protection Board and since  
17 during Phase Three, Dr. McTaggart-Cowan is, as I  
18 understand, to be cross-examined, you should arrange,  
19 Mr. Goudge for Mr. Jakimchuk's paper to be sent to  
20 Dr. McTaggart-Cowan so that he can read it before he  
21 is cross-examined which I take it will be some time in  
22 December.

23 Now, just before you  
24 show the slides. You have made it plain that the  
25 principle concern you have in relation to pipeline  
26 construction would be if it were to interfere with  
27 migration.

28 A That's correct.

29 Q You say that you're  
30 satisfied that the coastal route, the prime route  
would not seriously interfere with migration and you

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 say that in the very last sentence of your paper that  
2 it is your expectation that actual losses or effects  
3 attributable to the pipeline both short- and long-  
4 term will be negligible. Is that your opinion if the  
5 pipeline were to follow the interior route? Or does  
6 that remark -- does that opinion apply only to the  
7 coastal route?  
8

9 A With respect to the  
10 interior route, I think there would be some unavoidable  
11 interactions that take place that we cannot really  
12 percieve. The degree of unpredictability is greater  
13 there. I would not feel as confident in making that  
14 type of a statement for the interior route but I should  
15 also add, sir, that much of my concern for the interior  
16 route relates to other species apart from caribou.

17 Q Other mammals?

18 A Other mammals as well as  
19 caribou and I cite specifically portions of the  
20 interior route in Alaska. So from a mammal standpoint,  
21 overall, I do not favour the interior route. I think  
22 it would be more damaging from an overall mammal stand-  
23 point than a coastal routing and I stand by my  
24 conclusion with respect to the coastal routing for  
25 most species.

26 Q Well thanks.

27 MR. MARSHALL: Q Mr.  
28 Jakimchuk, did you want to make your slide presentation  
29 from here.

30 A Yes.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 I will very quickly go  
2 through these, Mr. Commissioner. You have seen some  
3 of them before during the over-view hearing. They  
4 will give you a graphic view of some of the things I  
5 have been talking about.

6 This is the general  
7 range of the Porcupine herd. You will notice that  
8 it encompasses most of the northern Yukon and well  
9 into northeastern Alaska.

10 Here, this is a  
11 generalized diagram showing the yearly cycles and  
12 patterns I referred to. Wintering in the central Yukon  
13 another major wintering area, you will see where the  
14 red lines are off in Alaska, the east fork of the  
15 Chandalar and so on. Those are the two major wintering  
16 areas.

17 Spring migrations  
18 northward up the Richardson Mountains and via the Old  
19 Crow area.

20 MR. MARSHALL: Q Could you  
21 just go to the overhead and trace that out?

22 A Well, the problem is this  
23 is upside down. Okay, calving taking place along this  
24 segment of the coast. The basic yearly patterns that  
25 the caribou have followed over the last five years that  
26 we have studied them and from other evidence for  
27 a long time prior to that.

28 THE COMMISSIONER: I noticed  
29 you had the Alaskan Panhandle dipping into the  
30 Mackenzie Bay. We'll ignore that. There it is again.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

A Here we have four years of information presented and color-coded. You can see the two major wintering areas that I refer to that we have documented. You will also see the intrusions that I have to point out in '73- '74, '72-'73, a segment of the herd that has wintered along the coastal plain as well as the northern Richardson Mountains.

I would expect that to be different this year because possibly if there is a greater snowfall but we will have to see. The general wintering areas in any event.

Here are details of the spring migration of the herd in '71-'72. The thickness of the lines indicate where the major movements are. The other lines indicate smaller numbers of animals.

You will notice when we superimpose -- I'm having a little trouble here -- when we superimpose '73 and '74, there are variations but the basic pattern is the same, with one exception. You will notice a large blue line in the Brooks Range there. That indicates a major movement that took place out of the Chandalar wintering area because in '73-'74 a large portion of the herd actually wintered in Alaska.

Now, I talked about the calving grounds and their variabilities that we have documented. You can see the area of the calving grounds that we have delineated and the variations that have occurred from year to year. In general from the

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 Babbage River to well the Canning River, the Katakturak  
2 River is the main western limit but there have been  
3 small components a little further west than that.  
4

5 I talked about the  
6 dense post-calving aggregation that take place following  
7 calving<sup>at</sup> which time the entire herd forms very dense  
8 herds, comes together prior to the initiation of their  
9 summer movement.

10 The location of these  
11 aggregations are within the areas delineated there.  
12 1972 and 1973 from Barter Island to the middle of  
13 Camden Bay and a little further west in 1974. Also  
14 a little further west this last year.

15 Following that huge  
16 aggregation we get post-calving movements and the August  
17 dispersal. This time where they come back into Canada  
18 during approximately the tenth to the middle of July.  
19 They come back to the Richardson Mountains. The groups  
20 break up smaller and then they swing back into Alaska  
21 and they disperse so that during the August period  
22 they are just. They are very thinly distributed over  
23 many thousands of square miles.

24 This clockwise movement  
25 appears to be very traditional. I hate doing this  
26 but we overlay 1973 and 1974 data, we get virtually the  
27 identical types of movement. And one of our reports  
28 on caribou fences is quite interesting. It points out  
29 the correlation of the location of these fences with  
30 this summer movement cycle.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 I don't think this one is  
2 very edifying. The fall migration, it's pretty hard  
3 to trace the arrows, but what essentially happened,  
4 the big brown arrow after the August dispersal, there  
5 is a gradual coalescing of the animals and a general  
6 movement south to the winter range. In some years,  
7 however, the animals turn back and winter in Alaska.  
8 That is essentially what that portrays.

9 This one for '73 and '74, the  
10 same type of pattern, maybe a little simpler, and  
11 following that fall migration we have animals then  
12 on winter range and in some cases during the mid-  
13 October period, as occurred during '73 in particular,  
14 substantial movement westward into the drainage of the  
15 east  
16 /fork of the Chandalar River for wintering.

17 O.K., that's the annual  
18 pattern. I'll just show a few slides that show caribou  
19 doing these things.

20 Mr. Commissioner, I should  
21 point out that these slides are strictly on caribou.  
22 I did just show a much greater representation of  
23 mammals and their habitat during the overview, but  
24 I'm focusing right now on caribou.

25 Here is what a typical winter  
26 range looks like that's been utilized for feeding,  
27 cratering that has taken place through the taiga area.  
28 This happens to be in the area south of Old Crow about  
29 50 or 75 miles, and I mentioned about the fact that  
30 caribou are almost constantly mobile when they feed.  
You'll see when you get close these craters are not

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 next to each other where they tend to be dispersed  
2 across the landscape, but the grazing pressure in  
3 any one area is not usually very intense.

4 In the winter, in the late  
5 winter the groups tend to come together. You can see  
6 along to the left some of the taiga that is utilized  
7 as winter range, but we also have some mountaintops  
8 where temperature inversions create very favorable  
9 conditions for caribou so that they will gather there  
10 and they will do their feeding there. They will tend  
11 to aggregate in larger and larger groups until the  
12 spring migration is stimulated and then they start  
13 streaming along generally traditional corridors north-  
14 ward to the calving grounds. This particular group of  
15 mammals, this photo was taken in '71 on what we have  
16 termed the Old Crow route, the major migration corridor  
17 that passes through Old Crow.

18 In instances of deep snow  
19 single file travel is used, with the leaders spelling  
20 off. The snow is very deep and they wear quite a  
21 substantial channel or gully through it to make passage  
22 easier for the bulk of the herd. Even though caribou  
23 aren't directly observed migrating, their trails leave  
24 evidence of the route they have taken, and gives an  
25 approximate idea of the numbers of animals that have  
26 passed. This is Schaefer Mountain, which I am sure  
27 you've seen north of Old Crow, where the trail is  
28 left by a spring migrating group of caribou.

29 I talked earlier about the  
30 obstacles that they face. Here we have a cow caribou

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 in terminal stages of pregnancy. They have yet to make  
2 such crossings as the Porcupine River after breakup,  
3 ice flows, sometimes they get crushed, they face swift  
4 currents as well as some pretty formidable physical  
5 obstacles. There is an example there of a cow crossing  
6 the Porcupine. They reach the calving grounds and it's  
7 a very benign type of area compared to where they have  
8 just come from. This is a view on the Jago River in  
9 Alaska where we conducted a sound simulator experiment  
10 on the calving grounds, and you will see the grazing  
11 of cows and calves. Much of it looks like this. As I  
12 indicated earlier, they are not in large herds at this  
13 time, they are distributed over very large areas. You  
14 will notice how well-drained that appears to be, much  
15 of the snow has left in contrast to other areas.

16 Following calving, many of the  
17 bulls in the population arrive. This is prior to the  
18 formation of and following the post-calving aggregation.  
19 This is movements following the aggregation. The bulls  
20 arrive and the other herd components, and we have the  
21 onset of the summer movement with the calves growing  
22 very, very rapidly. The cows and the bulls now in  
23 velvet, their antler development quite advanced.

24 You've heard reference to  
25 caribou in these dense groups on summer movements.  
26 Here is a group in the British Mountains, up at the  
27 very highest of elevations to avoid insect harassment  
28 during this period of the year. This is the height of  
29 the fly season. They'll often reach for very high  
30 elevations or ice pans or areas of high winds. They

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 cross rivers in these dense groups during the courses  
2 of summer movement. This is a westward -- or sorry, an  
3 eastward movement across the Firth River. Here is an  
4 eastward movement across the Kongakut River in Alaska.

5 That's what it looks like at  
6 a little closer view. You notice that even though  
7 there is obvious movement taking place, the animals  
8 are grazing as they move. This is very characteristic,  
9 caribou are wanderers, they are very nomadic, they don't  
10 settle down for very long in a given area.

11 I talked about the August  
12 dispersal. You'll see a few black dots. This is the  
13 coastal plain actually looking west from the Richardson  
14 Mountains. At the time during August in which the  
15 animals are very widely dispersed over the landscape,  
16 they are dispersed right from the northern Richardson  
17 Mountains right through to Alaska. That's when they  
18 put on their fat, that's when they restore their  
19 energy reserves. This is some of the area that that  
20 dispersal takes place in, in the last two years some  
21 of the wintering at the northern foothills of the  
22 Richardson Mountains.

23 The fall migration is the  
24 time of the rut, the breeding period. Bulls have  
25 shed their velvet, they have their manes, are in  
26 very good condition and it's the time of movement back  
27 to the boreal forest, the winter range.

28 Just a few slides now, I made  
29 reference to some experimental and disturbance studies  
30 that we have carried out. Here is a shot of a caribou

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 utilizing a seismic line in the Eagle Plains area  
2 south of Old Crow. Here I believe on Old Crow  
3 Mountain part of our experimental study to ascertain  
4 the effects of compressor station noise on caribou,  
5 and there the two compressors are set up and this was  
6 during the spring migration.

7 The last shot is, we have heard  
8 about the propensity of caribou utilizing roadways.  
9 Here's a shot of them utilizing a gravel road in the  
10 area of Prudhoe Bay.

11 That concludes that.

12 Mr. Commissioner, I have just  
13 one parting word. Throughout all this I have talked  
14 about the gas pipeline. You've heard me conclude that  
15 the migration is vitally important. I would like to  
16 express my concern that there are situations that  
17 pose threats to the Porcupine herd, and I think it  
18 should be stated now, so that we are aware of them, and  
19 I think I personally am very concerned about the impact  
20 of the Dempster Highway on the herd, inasmuch as it  
21 involves those factors such as vehicular travel, a  
22 highway through their spring migration route and so  
23 on, and I would just like to point out that very close  
24 attention will have to be paid by various governmental  
25 agencies to ensure that that herd is maintained in its  
26 productivity with respect to the access provided,  
27 the impact of the Dempster Highway.

28 I would not feel comfortable  
29 knowing that we have discussed the pipeline at great  
30 length with respect to the herd, and ignored some of

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 the other things that are going on, and I would view  
2 I think that that has to be a consideration for that  
3 herd. That's my comment.

4 THE COMMISSIONER: Thank you  
5 very much, Mr. Jakimchuk.

6 Well, we might be better to  
7 adjourn now, Mr. Marshall.

8 MR. GOUDGE: It would be  
9 helpful if we could adjourn now. I have advised counsel  
10 that I think it might be useful if we met for a short  
11 time and discussed the order of cross-examining this  
12 panel.

13 THE COMMISSIONER: All right,  
14 well we'll adjourn now till two o'clock.

15 (PROCEEDINGS ADJOURNED TO 2 P.M.)

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

THE COMMISSIONER: Well, I  
think we're ready to begin.

MR. MARSHALL: Thank you, sir.  
I would ask Mr. Hemstock to outline the mitigative  
measures.

WITNESS HEMSTOCK: Mitigative  
measures described by the applicant were developed as  
a result of many, many consultations between environ-  
mental and engineering personnel and as a result of the  
stated policy of the company that the protection of the  
northern environment was of prime importance. It was a  
matter then of sitting down with all of the disciplines  
and attempting to provide an optimum course; one which  
would not necessarily be best for any single discipline  
but which would in the overall provide the greatest  
facility for total environmental protection. I should  
probably point out too that I do not regard the present  
proposal for mitigative measures as a static proposal.  
Studies are continuing, a great deal more will be  
learned through disturbance studies and on-site  
evaluation of northern pipelines between now and the  
start of construction, and it will be my object to see  
that efforts continue to improve and upgrade our  
protective measures.

Arctic Gas has already taken  
many of the steps which are required to ensure that the  
mitigative measures are implemented. These involve the  
studies which have already been completed and the  
gathering together of the broad knowledge about the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 environment which is illustrated, not only in the appli-  
2 cation but also in the various reports which have been  
3 published. In the next phase of the planning, which  
4 we perceive as being design engineering, where more  
5 detailed knowledge is gathered on specific sites and  
6 where more precise information is prepared with regard  
7 to design, the input will be received from all of  
8 the environmental disciplines in order to ensure that  
9 good engineering design is also good environmental  
10 design. Finally, when it comes to the construction, the  
11 mitigative measures will be implemented through the use  
12 of inspectors. The inspectors will have adequate  
13 training in the environmental disciplines and a know-  
14 ledge of pipeline construction. The inspectors on each  
15 spread will be responsible to the Arctic Gas spread  
16 manager for day to day field work but will have as well  
17 direct contact to the Director of Environmental Studies  
18 with regard to technical matters. They will be on the  
19 site at the various spreads in order to make sure that  
20 baseline conditions are as expected and that these  
21 conditions which are then found on-site are still best  
22 handled by the mitigative measures outlined. It is a  
23 matter of company policy/ that such mitigative steps  
24 will be taken, and that every  
25 measure possible will be implemented in order to prevent  
26 undue disturbance of the natural environment.

27 Now to treat impact assess-  
28 ment, my overall assessment of the environmental impact  
29 of the project is described in Chapter 7 of 14.d. This  
30 chapter discusses the environmental impact of the project

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 in both the short-term and long-term under eight  
2 major headings, and these are: terrain and minerals;  
3 water resources; air; aesthetics; vegetation; fish;  
4 birds; and mammals. The changes to the environment  
5 are considered in four ways:

6 1. The nature of the change which consists as we  
7 perceive it, in the physical alteration of the  
8 topography and the vegetation;

9 2. The potential secondary alterations such as  
10 siltation or erosion;

11 3. The alteration to the natural undisturbed environ-  
12 ment due to the presence of machines and people;

13 4. The secondary alterations which result from No. 3,  
14 such as harassment.

15 The degree of change is  
16 also a factor and consists of the immediate extent and  
17 intensity of the alterations, and the secondary scope  
18 of the alterations. A brief review of the impact of the  
19 project by separate disciplines is contained in the  
20 assessment statement. Previous panels have discussed  
21 terrain, air and water.

22 Section 7.2, 7.3 and 7.4  
23 have been dealt with by a previous panel. Section 7.5  
24 deals with aesthetics. There will be an alteration of  
25 a limited area, both along the pipeline and at compres-  
26 sor stations and these structures or installations will,  
27 in fact, change the original condition. The applicant  
28 has considered the various aesthetic concerns during  
29 detailed planning and construction so that insofar  
30

as possible, the essential quality of the landscape upon the completion of the pipeline will be as satisfactory as possible. It will be the object of those concerned with aesthetic considerations to make both the pipeline right-of-way and the pipeline installations blend as closely as possible with the present landscape.

Professional archaeologists will be employed to supervise the work and make sure that the materials recovered are properly recorded and assessed, and the results made available to the scientific community.

Now to summarize the impacts, it has been Arctic Gas policy to consider advice from all of the environmental consultants with regard to the pipeline route and construction and operating factors and to accommodate where possible their recommendations. It should be noted, however, that it is the responsibility of the staff of Canadian Arctic Gas to arrive at a final judgment in the event of conflicts between the various disciplines studying the environment.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimuhuk  
In Chief

1                                   It was my responsibility to  
2 see that the environmental impact stated in Section  
3 14.d of the application met the guidelines set by  
4 the government and that it accurately reflected the  
5 information received from our specialists in the  
6 various disciplines.

7                                   With regard to vegetation,  
8 it is my opinion that in terms of habitat the  
9 vegetational effects will be minimal. There will be  
10 an edge effect along the right-of-way and agronomic  
11 species will be introduced for the short-term but they  
12 will be replaced by native species. The early 1940  
13 seismic lines and winter roads and those of more  
14 recent times well illustrate the natural restabilization  
15 which takes place in disturbed areas in the Arctic.

16                                  With regard to fish, one of  
17 the major concerns is the matter of siltation. However,  
18 the very small portion of the stream basins that will  
19 be affected by the pipeline activity and the practice  
20 of winter construction would indicate to me that the  
21 impacts here would be short-term and localized.

22                                  Oxygen levels are low in  
23 northern waters in winter and the applicant is fully  
24 aware that extra precautions will have to be taken to  
25 prevent the inflow of any contaminants into water courses.  
26 In all the years of shipping up and down the Mackenzie  
27 and in particular the last decade of moving chemicals  
28 and fuels to drilling well-sites, the record has been  
29 good and the applicant will strive to make it better  
30 in the operations which lie ahead. More access as a

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 result of the development will mean more fishing, and  
2 this of course must be controlled through the game  
3 management process.  
4

5 With regard to birds, I  
6 believe that the impact of habitat loss on birdlife  
7 will be minimal. Our greatest concern lies in the  
8 matter of disturbance - disturbance of populations  
9 at critical times by human activity, by noise and by  
10 aircraft overflights. We will do our utmost to control  
11 the activity of those employed on or on the periphery  
12 of our area of activity in order to minimize disturbance.  
13 There is nevertheless a core of activity which must go  
14 on in the summer during construction of compressor st-  
15 ations. There will be one year of major activity along  
16 the coast for shipment of major amounts of freight to  
17 the construction sites. I do not believe that there  
18 would be much impact from staging during the short  
19 periods required for this activity which will include,  
20 of course, the off-loading of barges and the construction  
21 of the necessary staging sites themselves.

22 A greater concern might be  
23 that of activities over the long-term with regard to  
24 the operation of the pipeline. This will include the  
25 servicing of compressor stations and the inspection  
26 of the pipeline. The applicant states that one to three  
27 flights per week at higher altitudes and on controlled  
28 flight paths will be required to service the compressor  
29 sites, and that one or two flights per month along the  
30 right-of-way at low altitude will be utilized for

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 pipeline inspection. I submit that this amount of air  
2 traffic must be evaluated in the context of past  
3 activity in order for us to project the probable new  
4 impact on birdlife. We know that the Dew Line was  
5 constructed and maintained at sites along the Arctic  
6 coast and that much of the support of this activity  
7 was by air. The level of activity for Dew Line sites,  
8 while not directly comparable, certainly shows that  
9 the coastal plain has been subject to disturbances in  
10 the past and that the pipeline construction and  
11 operation is not markedly different in total than some  
12 of the past perturbations.

13 As noted in 13.b.1, one to  
14 three flights per week are expected to be required  
15 for servicing compressor stations. To serve the  
16 critical North Coast of the Yukon area with its three  
17 stations would require from 20 to 30 hours of flying  
18 per month, or 240 to 360 per year. The schedule could  
19 be reduced during the critical three to four weeks the  
20 birds are staging for migration.

21 With regard to mammals, the  
22 main concern is with the Porcupine caribou herd. The  
23 impact, in my opinion, will be alleviated by winter  
24 construction and by the monitoring and controls which  
25 the applicant will apply during the construction and  
26 operation. Other large mammals will not be greatly  
27 affected. Furbearers are not likely to be affected as to  
28 numbers and the edge effect of the clearing of the  
29 right-of-way will change and perhaps improve some minor  
30 habitat, but nevertheless will be a small impact in the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 overall scheme.

2  
3 Q Thank you, Mr. Hemstock,  
4 and now Dr. Banfield.

5 WITNESS BANFIELD: Mr. Commis-  
6 sioner, the purpose of my testimony is to evaluate  
7 from an overall environmental or ecological standpoint,  
8 the applicant's proposal in this proceeding, having  
9 consideration for the impact of the construction,  
10 operation and maintenance of the proposed pipeline and  
11 related facilities principally upon vegetation, mammals,  
12 birds and fish life in the area in which the pipeline  
13 would be located.

14 I would like to explain my  
15 role in the project. In March, 1971, the predecessor  
16 to Northern Engineering Services invited me to serve  
17 as a consultant in the field of mammalogy. It was  
18 proposed that I should undertake a general review of the  
19 mammal research studies which were to be conducted  
20 by Renewable Resources Consulting Services Ltd. The  
21 actual field work would be conducted by Renewable  
22 Resources and my work would be to review its planning  
23 and research. I was asked to go into the field and  
24 work with and advise the field staff, and to review the  
25 field reports. I commented to Renewable Resources and  
26 Northern Engineering Services on such reports as far  
27 as the scientific excellence or logic was concerned  
28 and with respect to the need for certain research projects.

29 Since 1971 my role in the  
30 project has evolved into one of serving as a general  
environmental consultant. Over the past several years

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1  
2 the officials of Northern Engineering and the  
3 applicant have asked me questions dealing with subjects  
4 other than mammalogy, and I would give them my opinion  
5 or advice. There is perhaps a very good reason for  
6 this, inasmuch as I have had extensive field experience  
7 of a very general nature. For instance, in my caribou  
8 studies in the 1940's, I was required to do all of the  
9 vegetation analysis myself, and therefore am familiar  
10 with the literature on Arctic ecology from a plant  
11 ecology standpoint. In addition, I am familiar with  
12 climatology and the physical environment of the Arctic.

13 Also, since 1971 I have be-  
14 come interested in the philosophy and practice of  
15 environmental and sociological impact assessments.  
16 It is my general interest, coupled with the experience  
17 which I believe has led me into a role of a more  
18 general nature, i.e. the review of the environmental  
19 studies.

I have been involved from the outset of the environmental work in the project and have had a role in determining the types of studies that ought to be undertaken. I suggested a number of areas that ought to be investigated, for example, an archaeological salvage study. I also suggested studies relating to mammals, namely: a study of the environmental impact of compressor station noise on wildlife; and, a study on whether native mice would destroy the grass that would be replanted on the right-of-way. I was responsible for recommending the study of the effect of the pipeline on fur-bearers and the impact of that effect on the native trapping industry in the North.

I was consulted with respect to employment of individuals or firms to do some of the environmental studies that were carried out. I have had a role in reviewing the reports of the consultants as they have come out and I have been involved in the editing process with respect to many of these studies. In this regard, I participated in the preparation of the environmental assessment portion of the application. I have, particularly in the area of mammal studies, been more directly involved in assuring that a good research program in Northern mammalogy was undertaken.

Finally, I have attempted to maintain a continuing dialogue with environmental and conservation groups in order to determine their concerns with respect to the environmental impact of the project.

Banfield, Dabbs, Gunn, Hemstock,

In Chief.

1  
2 THE ENVIRONMENTAL IMPACT ASSESSMENT PROCESS

3 I would first like to comment  
4 upon the environmental impact assessment process and  
5 the methodology of environmental impact prediction. The  
6 art, or science, of environmental impact assessment  
7 is still in its infancy. The American National  
8 Environmental Policy Act of 1969, is generally accepted  
9 as the starting point. Up to the present, government  
10 guidelines have been very general and only a few assess-  
11 ment methods have been tentatively recommended. There  
12 is no generally accepted single method of analysis. The  
13 environmental impact studies sponsored by the applicant  
14 commenced in the spring of 1971, and may be considered  
15 as pioneer studies in the field in Canada.

16 In terms of the environmental  
17 impact assessment process, it is significant that in  
18 this project, environmental planning was conducted from  
19 the beginning simultaneously with engineering planning.  
20 Both environmentalists and engineers addressed them-  
21 selves to the concerns of alternatives, long-term and  
22 short-term impacts, direct and indirect consequences  
23 as well as cumulative effects of the pipeline on other  
24 facilities.

25 It is also significant that in  
26 this case the environmental impact assessment was con-  
27 ducted prior to approval being granted for the project.  
28 The environmental impact studies of several similar  
29 large projects were conducted after the decision had  
30 been made to go ahead with the project, or after con-

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

struction had been commenced.

I would also like to comment upon the relationship between environmental impact assessment and environmental protection. Environmental impact assessment naturally forms part of the engineering planning phase and final design stage. At that time mitigative procedures and contingency plans may be developed. Environmental protection is an active phase commencing at the construction stage and is accompanied by environmental monitoring. It is the responsibility not only of the sponsor but also of the governmental agencies involved and the concerned public. The environmental consultants engaged by the applicant were charged initially with the environmental impact prediction and later with defining mitigative procedures and monitoring. The Environment Protection Board has directed its attention primarily towards the subject of environmental protection.

#### ENVIRONMENTAL IMPACT ANALYSIS

One of the earliest methods proposed for environmental impact analysis was the environmental matrix of Leopold, et al (1970). The matrix format indicates the interactions between environmental factors on one axis and construction and operational activities on the other axis. And excellent example of the environmental impact matrix has been presented by the Environmental Protection Board's 1974 Report No. III. Several authors have pointed out serious shortcomings of the matrix method of environmental impact

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2 analysis. In the first place the matrix lists only simple  
3 direct relationships between an environmental factor and  
4 one human activity. It cannot deal with complex inter-  
5 relationships involving several factors. We know that  
6 ecological relationships are typically a complex network  
7 of relationships between organisms and their environment.  
8 Secondly, the matrix is a static instrument. It deals  
9 with conditions at one point of time, it cannot describe  
10 a dynamic situation. We recognize that nature is  
11 constantly changing plant succession for instance.  
12 Finally the information provided in the matrix is of  
13 limited value. It may simply indicate impact or no  
14 impact, or provide a colour or figure indicating on  
15 an ordinal scale, indicating an ordinal scale such as  
16 high, medium or low impact. Such data are personal  
17 value judgments of the designer and not subject to  
18 strict statistical analysis.

19 It is now recognized that such  
20 a matrix is best used to identify environmental concerns,  
21 rather than to present a final environmental impact  
22 assessment. The environmental consultants associated  
23 with the project chose not to present such a graphic  
24 representation in the Environmental Impact Statement  
25 14d, because of these limitations. However, at an  
26 early stage of the studies such environmental concerns  
27 as the effect of compressor station noise on caribou  
28 and the effect of regular maintenance flights on staging  
29 snow geese were identified in list form for further  
30 study.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
In Chief.

1  
2  
3                   Indeed, the consultants  
4 associated with this project chose to use standard  
5 scientific experimental methodology to obtain  
6 quantitative data from impact simulation studies. The  
7 main advantages of this method are that quantified data  
8 are obtained, decibels, miles, altitudes in feet,  
9 numbers of animals responding to a disturbance, etc.;  
10 and these are subject to normal statistical analysis.  
11 These data may be judged objectively by a second party  
12 choosing his own criteria and standards. Another  
13 advantage is that this information forms part of the  
14 general science data base available to all scientists  
15 interested in northern ecology.  
16

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Another method we might have used is the cost/benefit analysis. This method may be used effectively in certain natural resource cases such as an evaluation of the impact on the trapping industry. However, it would not be acceptable for an overall environmental impact assessment as many environmental values such as "wilderness" are intangible and not equatable to dollars and cents.

We have made use of one of the standard methods of environmental impact analysis in the presentation of map overlays as represented by the wildlife distribution atlases.

Several environmentalists (including those among our own consultants) proposed an ecosystem approach as the ultimate goal in assessing the environmental impact of the project. Hopefully at some future date such an analysis may be possible. Unfortunately, at this time we do not have the techniques, nor baseline case studies available for comparison. Currently this method calls for extrapolation of findings from the I.B.P. sites at Point Barrow, Alaska, Devon Island and Char Lake, Cornwallis Island (in the Canadian Arctic Archipelago). Originally it was thought that the Arctic and Subarctic ecosystems were "simple". We are now learning how many varied ecosystems there are in the north. Certainly each of the main tundra plant communities compose a distinct ecosystem type as well as several in the coniferous forest. Aquatic ecosystems include: marine, esturine, coastal lagoons, lakes, tarns -- that's a Scottish

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

word by the way meaning tundra pool -- and several river and stream ecosystems. A complete analysis of energy flow through all of these is an impossible task at present. As a result of these considerations we chose to study the important "indicator" species such as spruce, willows, sedges, grasses, caribou, wolves, geese, raptors, Arctic char and grayling. These are not only important economic species to man but are dominant links in the energy flow through their ecosystems. If an important dislocation were to be produced in an ecosystem, it would probably be identified early in the population change of one of these "indicator species".

Frequent mention has been made of the baseline studies conducted by the Applicant during this hearing. Very few intensive studies had been conducted in the region through which the pipeline might pass because of its remoteness prior to the initiation of the Applicant's environmental program.

I believe it is generally recognized that in this case industry has made a tremendous contribution to basic environmental studies in Northern Canada and in Alaska as well, particularly the northeast corner of Alaska. Government agencies and the foundations such as the Arctic Institute of North America had not previously had the funds to undertake studies at the level that has been undertaken with respect to this project. The project has made a major contribution to our knowledge of fish and wildlife in

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 this large area of North America. I believe that we  
3 now have sufficient information to form the basis of  
4 an adequate environmental impact assessment and of  
5 mitigative procedures to protect the environment.

6 In the field of predic-  
7 tive studies, we must recognize our limitations at  
8 the present state of knowledge. After all we are still  
9 having trouble in forecasting tomorrow's weather, the  
10 stock market closing quotations, or next year's  
11 unemployment figures. It is perhaps rather glib to  
12 state that the future is dynamic. It is difficult to  
13 predict the input of many dynamic variables to  
14 future events.

15 "Worst Case" analysis  
16 has become a recognized part of the environmental  
17 impact analysis since 1972. It is comparable to con-  
18 servative engineering design specifications for build-  
19 ings or bridges. It is also used in the land use  
20 planning process. It is related to risk prediction.  
21 True, "worst case" examples are based upon long records  
22 of events that can be reduced to a probability. Such  
23 records are: 50 year flood levels, ship collisions at  
24 sea, pipeline ruptures per mile/year, train wrecks  
25 per mile/year, air disaster per air-mile, or earth-  
26 quakes of magnitude 6 (or 8) per 100 years. Each such  
27 data -- with such data on hand one can predict a "worst  
28 case" using whatever criteria you wish: 50 year flood  
29 levels or 100 year seismic risk. Unfortunately, we  
30 have not built up many of the required data for northern

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1 Canada to offer a valid "worst case" prediction. In the  
2 case of the caribou, for instance, the worst case his-  
3 tories described in the literature relate to the  
4 construction of railways and permanent roads across  
5 caribou range. The data for elevated pipelines are also  
6 suggestive. I am not aware of any data associated with  
7 the construction of a buried pipeline that would offer  
8 the basis for a worst case prediction.

9  
10 Scenario writing is also  
11 considered to be a legitimate method of future studies.  
12 A scenario describes a possible course of events  
13 assuming certain conditions, usually starting with  
14 current events. A number of scenarios relating to the  
15 same variables should be compared. There are  
16 several well known realistic but disturbing scenarios in  
17 ecology such as Rachel Carson's introduction to Silent  
18 Spring (1962) or Erhlich's Eco-Crisis (1970). Some  
19 forecasts of dire consequences to caribou or snow  
20 goose populations as a result of the construction of a  
21 northern gas pipeline must be recognized as similar  
22 "environmental doomsday" scenarios. They are personal  
23 value judgments that should be balanced with other  
24 more optimistic scenarios in the decision-making  
25 process.  
26  
27  
28  
29  
30

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 For my part, I would prefer  
2 to draw conclusions based upon our simulated impact  
3 studies and the generally accepted literature on  
4 caribou ecology and behaviour. Over the past 40 years  
5 the caribou herds have been studied scientifically in  
6 Canada, the numbers have waxed and waned. We have thought  
7 that factors such as climate, forest fires and hunting  
8 have been important factors, but the records do not  
9 always confirm our opinions.

10 The acceptability of the  
11 environmental impact. When an environmentalist reaches  
12 the point of drawing a conclusion from his impact  
13 analysis, he finds that there is no generally accepted  
14 method of stating his conclusions. In most  
15 cases environmentalists are forced back to use personal  
16 value judgments in expressions such as,

17 "little environmental impact, or serious  
18 detrimental environmental impact."

19 More recently authors have defined their expressions  
20 in more objective terms such as,

21 "loss of 10% habitat," etc.

22 I favor the test for the  
23 acceptability of expected environmental impacts  
24 by comparing the predicted environmental effects of  
25 the proposed human activity with the observed environ-  
26 mental effects of natural disturbances. At present  
27 this test is only in the conceptual stage and can  
28 only be used as a method of direct observation. In  
29 the case of some environmental factors such as  
30 dissolved solids in aquatic ecosystems, the quantified

Banfield, Dabbs, Gunn  
Hsmstock, McCart, Jakimchuk  
In Chief

1 data are available to test the concept at a mathematical  
2 level. This has been done in the U.S. Department of  
3 the Interior's Final Environmental Impact Statement on  
4 the Garrison Diversion in North Dakota, 1974.

5 There, the predicted increase in dissolved solids in the  
6 rivers was compared with the fluctuations in the natural  
7 loads before implementation.

8 There are many natural dis-  
9 turbances such as solifluction, slumpings of the active  
10 layer, caribou trails, wildfire, and stream erosion  
11 which cause local environmental disruption to certain  
12 physical and biotic components in the environment.

13 However, other natural forces such as soil erosion,  
14 sedimentation and plant succession heal the disturbances  
15 in a natural time span. I believe that where, as here,  
16 the impacts resulting from human activity such as clear-  
17 ing a right-of-way, trenching, backfilling, and crossing  
18 rivers are no greater than disturbances due to the  
19 natural phenomena discussed above, and especially where  
20 we are assisting natural plant succession by revegetat-  
21 ing the right-of-way, then the environmental impact is  
22 acceptable.

23 I have proposed that the comp-  
24 arison between impacts should be based upon local  
25 natural disturbances. A problem is encountered in extend-  
26 ing the comparisons over such a broad scale as to  
27 include natural catastrophes such as earthquakes, vol-  
28 canic eruptions, or 100-year flood levels. Such  
29 extreme examples might not be considered as  
30 acceptable impacts by many. One must set arbitrary

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 limits to the scale. I have chosen to use a comparison  
2 natural disturbances such as stream erosion, active  
3 layer slumps, solifluction, natural fires that occur  
4 with a frequency of about once in five to ten years.  
5 This approximates the time scale in which we expect  
6 the revegetation of the right-of-way to be effective.

7 While this test applies well  
8 to the pipeline right-of-way, it is less effective  
9 when applied to the construction and operation of  
10 other facilities such as compressor stations.

11 The environmental impacts of such facilities are site  
12 specific and must be analyzed individually. There is  
13 still one component of the total impact that might be  
14 treated objectively on a comparative basis, that is  
15 the amount of habitat removed by the gravel pad from the  
16 total habitat available to populations of plants and  
17 animal species. This might be compared to landslides  
18 in mountainous terrain. However, a large component  
19 of the total impact of these facilities falls within  
20 the area of aesthetics, which is subject to differing  
21 personal value judgments. This problem was discussed  
22 in the Garrison River Diversion Environmental Impact  
23 Statement and such impacts were described as problematical.  
24 In these cases we are forced to use the language of  
25 personal value judgments such as little or major  
26 environmental impact.

27 Similarly, there is no method  
28 available to evaluate the total impact of the project  
29 on the combined components of the environment such as  
30 fishes, birds and mammals, from an overall standpoint.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 Quantitative data can be collected on the responses  
2 of individual environmental components to different  
3 magnitudes of disturbance. For example, we can measure  
4 responses of snow geese to aircraft disturbances,  
5 or caribou to simulated compressor station noise.  
6 Unfortunately so far the summation of the relative  
7 importance of these disturbances to geese and caribou  
8 is still in the area of personal value judgment of  
9 experienced environmental biologists, or better a team  
10 of experienced biologists.

11 For my part, I still try to  
12 quantify my conclusions.

13 In this instance since both  
14 snow geese and caribou are herbivores in the ecological  
15 scheme, they are strictly comparable, their combined  
16 population biomasses may be compared to obtain a  
17 figure of relative ecological importance. Or you might  
18 consider their importance as food to northern native  
19 residents. (In each of these comparisons, the caribou  
20 appear to be more important).

21 Cumulative impact assessments.  
22 We recognize the complex web of relationships between  
23 man's physical environment, cultural backgrounds and  
24 social and economic factors. Few attempts have been  
25 made by systems biologists to produce conceptual or  
26 mathematical models of the world system. The general  
27 systems approach is to break down the larger system  
28 into smaller sub-systems and to study the inter-relat-  
29 ionships within each, and then try to fit them together.

30 In this case we have studied

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
In Chief

1 the environmen tal impacts of the proposed pipeline  
2 as a component of a larger complex. Others have studied  
3 other components such as the impacts of the petroleum  
4 production industry.

5 Many future developments in  
6 the north such as political evolution, population growth,  
7 growth of service industries, perhaps a railway are  
8 quite unpredictable at the present. I think that each  
9 future major development should also be analyzed for  
10 its social and environmental impact when each is  
11 proposed.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Mitigative Procedures --

When I became associated as a consultant to this project, I started working with the engineers and other environmental consultants. Through our review processes we have been able to isolate each one of the environmental concerns. We have attempted to define each concern in a context in which it could be investigated, that is, in terms in which quantitative data could be gathered and the results obtained objectively appraised.

The major engineering features, that is, the buried and chilled pipeline, backfilling and re-vegetation, laid to rest much of the environmental concern which I had. Adjustments to the routing of the pipeline away from sensitive areas laid to rest other concerns. Arctic Gas' test facilities demonstrated its ability to mitigate potential adverse physical environmental impacts. Other procedural adjustments were made: the use of winter roads, and ice roads, light impact-wide tracked vehicles, the development of management procedures such as control of personnel, aircraft flight patterns, and local terrain restoration procedures. It was simply a matter of running down concern after concern, documenting it, collecting data on it, simulating the real situation where possible, and then taking readings of how wildlife actually responded to these simulated situations. Of course, we are still confronted with actually building the pipeline and encountering unforeseen problems. But here we must rely on contingency planning to deal with individual problems as they may occur in final design.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 It may take innovation  
3 from time to time, but I am confident innovations will  
4 be forthcoming to deal with local problems.

5 Residual Impact -- As  
6 a result of my overview studies I have come to the  
7 conclusion that the construction and operation of a  
8 buried, chilled pipeline along the Applicant's Prime  
9 Route will not have a significant detrimental impact  
10 on the components of the living environment. It is  
11 my opinion that there will actually be little direct  
12 adverse impact on wildlife, fish and vegetation along  
13 the proposed route if it is constructed and operated  
14 according to the plans developed by the Applicant. Most  
15 of the detrimental impact will be indirect in nature as  
16 a result of increased human disturbance. With the  
17 completion of the Dempster and Mackenzie Highways in-  
18 creased future human activity along the route is  
19 inevitable.

20 I have also concluded that  
21 the proposed Prime Route is significantly preferable  
22 to the Interior Route, on the basis of an overall  
23 assessment of biological environmental concerns.

24 I admit that these con-  
25 clusions are largely personal value judgments, but they  
26 are supported by the Applicant's quantitative  
27 experimental data and twenty five years experience in  
28 northern ecological research.

29 MR. MARSHALL: Thank you, Dr.  
30 Banfield. Mr. Hemstock, I believe you indicated in

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 your evidence that you had overall responsibility for  
3 the preparation of the environmental statement for  
4 Canada, north of sixty, which is marked Exhibit 57.

5 WITNESS HEMSTOCK: A Yes, sir.

6 Q I take it, it would follow  
7 then, sir, that you support the summary of the impacts  
8 that are set out in the exhibits?

9 A Yes, sir.

10 Q Mr. Dabbs, within the  
11 area of your discipline, do you have any comments to  
12 make on the impact, the environmental impact statement  
13 Exhibit 57, as it pertains to vegetation? Do you  
14 support the summary of the impacts that are set out  
15 in the exhibit as they relate to your discipline?

16 WITNESS DABBS: A I have  
17 no other comments and I support that.

18 Q Thank you. Dr. McCart,  
19 in the area of the aquatic environment, are you in  
20 agreement with the summary of impacts that are contained  
21 in the Exhibit 57?

22 WITNESS MCCART: A Generally  
23 yes.

24 Q Do you have any other  
25 comments that you want to make pertaining to it not  
26 already spelled out in your evidence?

27 A No, I think not.

28 Q Mr. Jakimchuk, in the  
29 area of mammals, do you agree with the summary of the  
30 impacts as set out in the environmental statement of the

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

Applicant -- Exhibit 57?

WITNESS JAKIMCHUK: A Yes, I  
do.

Q Mr. Gunn?

WITNESS GUNN: A I would  
like to make exception to Dr. Banfield's theory that  
bigger is necessarily better when comparing caribou  
and snow geese.

MR. MARSHALL: I think we could  
all see that one coming, sir. Dr. Gunn, specifically  
with respect to the environmental statement of Arctic  
Gas which is marked as Exhibit 57, the Environmental  
Statement of Canada, North of Sixty, are you in general  
agreement with the summary of the impacts that are  
set out as they relate to your discipline?

A That is not what we know  
as 14D, is it?

Q Yes, 14D.

A I have a few minor -- I  
agree with it in general terms. I have a few minor  
disagreements but they are all of a minor nature.

Q Fine, thank you. I have  
no further questions of the panel. Mr. Commissioner,  
Dr. Gunn mentioned to me that there has been a film  
prepared that describes the environmental research that  
has been carried out and includes a description of the  
disturbance studies that were carried out and it is  
entitled "The Arctic, The Wildlife, The Pipeline". It  
was produced by Robin Gunn Ltd. for Arctic Gas in 1973.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief

1  
2 It is a 28-minute film. The members of the panel  
3 thought that it would be of interest to the Inquiry.

4 I'm not suggesting we  
5 show it now, sir, perhaps I could speak to Mr. Goudge  
6 about a suitable time. I think my learned friend is  
7 anxious to commence his cross-examination but I think  
8 perhaps later in the week or when the panel returns  
9 we'll find an appropriate time to show the film.

10 THE COMMISSIONER: Certainly,  
11 fine.

12 MR. GOUDGE: Or it may be, sir,  
13 that it will have material in it that would form the  
14 basis for questions. It might be better to do it  
15 earlier rather than later in the process of dealing  
16 with this panel.

17 MR. MARSHALL: Well, the film  
18 is here, sir. It would just simply be a matter of  
19 setting up the projector which we could do.

20 THE COMMISSIONER: You haven't  
21 seen it.

22 MR. MARSHALL: I haven't seen  
23 it. Mr. Carter has seen the film and I believe Mr.  
24 Goudge has seen it.

25 THE COMMISSIONER: Well, why  
26 don't we --

27 MR. MARSHALL: We could break  
28 for coffee now, sir, and then set it up and show it.  
29 Is that -- ?

30 THE COMMISSIONER: Well, I was

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield--In Chief  
Cross-Exam by Gibbs

1 going to say, let's start off with some cross-  
2 examination and then at coffee break it could be set  
3 up. I thought we might wait till 4:30 or 5:00 and  
4 show it then when we had pretty well run out of steam  
5 or gas and everybody would welcome just sitting back  
6 and seeing a film.  
7

8 Just before we go on to  
9 anything else. Dr. Gunn, you said that the pipeline  
10 along the coast would do more damage from an  
11 ornithological point of view than it would if it were  
12 to run along the interior and Mr. Jakimchuk, you said  
13 it more damage if it were to run along the interior to  
14 the mammal population generally than if it were to run  
15 along the coast. Dr. Banfield, I take it you would  
16 agree with Mr. Jakimchuk's proposition?

17 WITNESS BANFIELD: A Yes, sir,  
18 I also agree with Dr. Gunn's analysis as well that if  
19 one were to consider the pipeline solely on the basis  
20 of ornithological concerns, the interior route is  
21 preferable.

22 Q But you, yourself, consid-  
23 ering it from an overall point of view think it would  
24 do more damage along the interior route than it would  
25 along the coast? That is, lumping the birds and the  
26 mammals and everything else into one big package?

27 A Yes, and including as  
28 much as terrain disturbance as well down that far.

29 CROSS-EXAMINATION BY MR. GIBBS:

30 Q You have heard Dr. Banfield

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

1 tell us that all is well, it seems a little  
2  
3 to get down to some facts but perhaps I could start  
4 with Mr. Dabbs and ask him a few questions on his  
5 vegetation.

6 Could you turn to page 7  
7 of your prepared evidence, Mr. Dabbs?

8 WITNESS DABBS: A Page 7,  
9 mine starts at page 11.

10 Q I beg your pardon.

11 A I'm sorry. Yes.

12 Q You have page 7?

13 A Yes, I have it.

14 Q And would you look at  
15 the last paragraph where you say that "to gain an  
16 understanding of the structure and to a degree, the  
17 function of botanical components of the ecosystems tra-  
18 versed by the proposed pipeline, field investigations  
19 were undertaken which have produced the classification  
20 of the terrain and the associated plant communities."

21 Then you say, "By  
22 reducing the complex landscape to a manageable number  
23 of ecologically meaningful units".

24 How do you go about  
25 doing that?

26 A Just as described. It's  
27 a matter of classification of terrain to start with and  
28 then the classification of plant communities which are  
29 associated with land form units. These, then  
30 form those, what I consider ecologically meaningful units  
functioning biologically.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

1  
2 Q Well, describe for me  
3 an ecologically meaningful unit.

4 A Using then as an example  
5 which I think is the easiest way. The sedge -- using  
6 a simple one -- the sedge tundra communities associ-  
7 ated with depressional land forms in the Arctic coastal  
8 plain. Those in themselves are a meaningful unit.

9 They repeat themselves again and again across the  
10 landscape.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 Q A meaningful unit then  
3 is a type of soil with an associated kind of growth  
4 on it?

5 A A meaningful unit is a  
6 classifiable community which does encompass the  
7 soil and the land forms that it is associated with.

8 Q And in an ecologically/<sup>meaningful</sup>unit  
9 can you have more than one type of growth on that  
10 particular kind of soil?

11 A Oh, yes.

12 Q And do you then plot out  
13 a piece of ground and consider that to/<sup>be</sup>a meaningful  
14 unit and determine what the soil is and what the various  
15 types of growth are that are upon it?

16 A We never plotted it out  
17 or mapped it out as you described. We have classified  
18 and described those units in the various reports cited.

19 Q Well, sir I don't understand  
20 how you start with a complex and get to, and break it  
21 down into these manageable number because if you take  
22 a form of soil and everything that grows upon it, don't  
23 you have a complex landscape right/<sup>there</sup>in your selection?

24 A Yes, you have a complex  
25 landscape to start with. That is quite true and it  
26 doesn't change the complexity of the landscape but it  
27 organizes the landscape into meaningful units that can  
28 be dealt with individually.

29 Q Well, what do you do? Do  
30 you take something like you said sedge, and determine

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 where it grows, all the different kinds of soil and  
3 terrain and drainage and all the rest of it in which  
4 it grows?

5 A Sedge communities is an  
6 example. Use another obvious one. The white spruce  
7 communities that are found on river flood plains is  
8 a unit in itself.

9 Q And when you have gone  
10 through all that, you must have a vast number of  
11 ecological meaningful units?

12 A There is a large number, yes.

13 Q And how does that help you  
14 to understand the complexity of the total landscape?

15 A Well, sir without it, you  
16 would be speaking of something completely undefined,  
17 unorganized in your own mind. A classification of any  
18 system, whether it is a plant community of the Mackenzie  
19 Valley, whether it is a classification of genetic units  
20 within a species, is a function of a human mind that  
21 we have to organize things into related units before  
22 we can deal with them.

23 Q Well, maybe I am making  
24 it overcomplicated then. It is sort of a shopping list  
25 of what kind of plants grow on this kind of soil and  
26 this kind of temperature and drainage system?

27 A It is a matter of classical  
28 plant ecological investigation which starts with the  
29 classification of landscape. I am not sure what your  
30 question was just now.

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 Q Well, really it is a list  
3 of plants that grow in various parts of the northern  
4 environment. Isn't that what it is?

5 A Not quite because a list  
6 of plants can be generated without any classification  
7 of plant communities. I think/here, that may be  
8 the concept  
9 escaping us in this discussion, is that of communities,  
10 plant communities. We can list all of the species off.  
11 Maybe we would have 400 species in the Mackenzie Valley  
12 but we don't have 400, necessarily have 400 plant  
13 communities.

14 Q No. So what you do then  
15 is what I said. You select an area of ground and you  
16 determine what is in that plant community?

17 A That may be the procedure  
18 in arriving at that classification, yes.

19 Q Well that was what I was  
20 trying to get at. What procedure, how do you get to  
21 these meaningful ecological units?

22 A Well if that is the question,  
23 we could go through the steps very briefly. Vegetation  
24 is firstly organized by the influences of a climate on a  
25 broad scale, as we have discussed, as everybody in the  
26 room here is quite aware of, the change of structure  
27 from north to south, south from the tundra through open-  
28 forest tundra, through the boreal forest. That in itself  
29 is the first level of organization.

30 The next level of organization  
would be in the physiographic units. I think physio-

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.

Cross-Exam by Gibbs.

graphic, that in itself is another level of organization. In those physiographic units there is a breakdown of the terrain into land forms and I believe Dr. Mollard has gone on at considerable length defining for you what a land form is. That in itself is the next level of organization.

On those land forms then biota have organized themselves under the influence of climate and microclimate and material exposure etc. into communities that are associated with different positions on those land forms so that on one large land form you can have more than one plant community type. So that is the level of organization I am speaking of sir, so that we have them in some logical sequence and organization in order to deal with them in some logical manner.

Q All right. I understand. Would you turn now to page 8 of your prepared evidence, please. And again the last paragraph on that page, "A third area of research which has been underway for the past three years has been one of environmental monitoring. The objective of this program was to establish the natural conditions of drainage, soil and vegetation in a representative study area in the Mackenzie Valley prior to construction of either a highway or a pipeline." Where was the representative study area located?

A The particular study area referred to here is the Chick Lake Basin, Donnelly River system about 70 miles north of Norman Wells.

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1

2

3

study area be?

4

5

6

A I would have to check the  
map to give you an exact figure in numbers of square  
miles. It is an entire lake, river, drainage system.

7

8

9

Q I don't need exact numbers.

Can you tell me roughly in miles what dimension it was?

10

11

A The area covered in the  
study would be approximately 50 square miles as I recall  
from the map.

12

13

14

15

16

Q And you say, sir, that that  
is a representative study area? Do you intend to convey  
by that that the results obtained from your monitoring  
there, would apply anywhere throughout the length of  
your pipeline route?

17

18

A No, sir. It is representative  
of the mid-Mackenzie Valley.

19

20

Q Of that area of the Mackenzie  
Valley?

21

22

A The mid-Mackenzie Valley.

23

24

25

Q And so that really the  
results of your environmental monitoring there, really  
are of no help other than in that mid-part of the  
Mackenzie Valley?

26

27

A No, they are intended only  
to monitor changes in that area.

28

29

30

Q And have you plans for any  
of these representative study areas anywhere, anywhere  
else along your pipeline route?

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

24  
25  
26  
27  
28  
29  
30

A We have plans. We have made suggestions for future investigations to the client

Q Where?

A Those areas haven't been selected as yet but they would to be representative obviously we would need a situation in tundra regions and probably in the southern Mackenzie Valley.

Q Well you say later in that paragraph, "The objective will be to return to the same site during the time of construction and for a period of time following construction in order to measure and confirm environmental impact predictions". Are the environmental impact predictions contained in a volume that has been filed with us here?

A Yes, I am referring there to our predictions as I made in Exhibit 14 B.

Q I see. Will you turn now Mr. Dabbs, to page nine of your prepared evidence. And in the first paragraph you are speaking of a vegetation survey program and you say, "In 1947 the program was extended to include a case history study of existing pipelines in western Alberta, through the Crow's Nest Pass into British Columbia and across southwestern Saskatchewan. Would you define what you mean by a case history study?

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 WITNESS DABBS: A study  
2 of existing pipelines, sir; of course studies in the  
3 Mackenzie Valley have not been able to address them-  
4 selves to an existing pipeline as one simply doesn't  
5 exist. In this case south of 60 ~~there~~ are pipelines in  
6 existence largely parallel to the proposed Arctic  
7 Gas line that lend themselves to study.

8 Q And what were you studying  
9 in that case history study?

10 A We were examining the  
11 problems that had been associated with construction of  
12 pipelines as they deal with our field of restoration  
13 and erosion control, identification of erosion problems  
14 as they relate to different river crossings or terrain  
15 types; during the course of that work, of course, we  
16 did carry on a fair amount of sampling of currently  
17 undisturbed communities, forest communities as a data  
18 base or the calculation, up-dating of forest  
19 productivity tables for Alberta, in order to assess  
20 the loss of timber if a right-of-way is cleared through  
21 such areas.

22 Q What pipelines did you  
23 study?

24 A Through Alberta we  
25 studied the Alberta Gas Trunk Line system largely.

26 Q Not the entire system?

27 A No, not the entire system.  
28 The main trunk line south from the Hay River crossing,  
29 I don't know what the name used to refer to it, and  
30 at a number of places along the eastern slopes of the  
foothills, Alberta.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 natural gas pipeline through the Crowsnest Pass into  
2 British Columbia, Kingsgate, places along the Alberta  
3 Gas Tunk Line system as it crosses agricultural  
4 lands en route to Empress and of course places on the  
5 TransCanada Pipeline system in Saskatchewan.

6 Q And was it part of your  
7 objective to learn something there which would be  
8 applicable north of the 60th Parallel?

9 A No, sir, the objective  
10 there was to know what we could about pipelines and  
11 their impacts in Alberta for that leg of the Arctic  
12 Gas project.

13 Q You don't expect to  
14 extrapolate any of what you learned there into any  
15 area north of the 60th Parallel?

16 A If it's possible,  
17 perhaps, but our objective was not necessarily to do  
18 so.

19 Q And is that case history  
20 study contained in any report or document that's been  
21 filed with this Inquiry?

22 A Not as yet; it has not  
23 been completed.

24 Q When do you expect it  
25 to be completed?

26 A In the next couple of  
27 months, but I would have to consult with the author.

28 Q You didn't conduct the  
29 study then?

30 A No, a member of my staff

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 conducted the study.

2 Q Could I enquire of you,  
3 sir, through Mr. Marshall, whether this study will be  
4 produced when it's been completed, to Mr. Commissioner?

5 MR. MARSHALL: Who do you  
6 want to answer the question, the witness, me, or the  
7 Commissioner?

8 MR. GIBBS: I asked the Commis-  
9 sioner if I could enquire through him of you whether  
10 the study would be produced when completed.

11 MR. MARSHALL: I don't see any  
12 reason why it couldn't be. Mr. Hemstock can speak for  
13 the company as to what their plans are for publication  
14 of it. Will it be published?

15 WITNESS HEMSTOCK: I see no  
16 problem in publishing it.

17 MR. GIBBS: It will be volun-  
18 tarily furnished here when it's ready, is that right,  
19 Mr. Hemstock?

20 A Yes.

21 Q On the same page 9, in  
22 item No. 3, Mr. Dabbs, you say that your survey program  
23 in 1975 was to indicate some of the problem areas on  
24 the pipeline route and make recommendations regarding  
25 terrain stability based on the vegetation study. Is  
26 the result of that, that 1975 survey which you refer to  
27 in paragraph 3 in a form yet that can be filed with  
28 this Inquiry?

29 WITNESS DABBS: No sir, these  
30 objectives as stated on page 9 are objectives set out

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
CrossExam by Gibbs

1 as part of the vegetative survey and that information  
2 is contained within the reports on each survey. So  
3 those surveys that have been published and filed  
4 -- that information is available and as other surveys  
5 are completed that type of information will be included.

6 Q Well, with specific  
7 reference to item No. 3, have you received, as a result  
8 of the 1975 survey program an indication of the problem  
9 areas and recommendations regarding terrain stability  
10 based on the vegetation study?

11 A I have not specifically  
12 as yet. It's being analyzed.

13 Q But you anticipate that  
14 you will?

15 A I do, yes.

16 Q And when do you expect  
17 to receive that?

18 A As part of the report  
19 that we just discussed.

20 Q In the next couple of  
21 months --

22 A Yes.

23 Q -- and as part of what  
24 Mr. Hemstock has agreed to produce.

25 A Yes.

26 Q And does the same answer  
27 apply to items 4, 5, and 6 on page 9?

28 MR. MARSHALL: I'm not sure I  
29 understand that. This is just a set of the objectives  
30 that apply to each of the survey programs.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 MR. GIBBS: All right, sir.

2 MR. MARSHALL: If I understood --

3 MR. GIBBS: I'll do it so you  
4 can understand it, Mr. Marshall.

5 Q Mr. Dabbs, as a result  
6 of your 1975 survey program have you received informa-  
7 tion for right-of-way clearing and cost calculations  
8 based on shrub and tree cover?

9 WITNESS DABBS:

10 A That information has  
11 and is being calculated for the area south of 60 as  
12 part of specifically that '75 program. The data  
13 generated in that program has been used in those  
14 calculations.

15 Q But I thought that this  
16 1975 survey program included the cross-delta route  
17 plus a new routing in the Fort Simpson area.

18 A Well, sir, we're confusing  
19 then what you -- or I have been confused by what you  
20 mean when you refer to the '75 survey. There are three  
21 different programs we seem to be talking about:  
22 (1) the south of 60 case history study; the 1975  
23 cross-delta, and the Fort Simpson area. I would ask  
24 that you refer to them individually so that I understand  
25 what you're asking.

26 Q All right then, Mr. Dabbs,  
27 as a result of your 1975 survey program, have you re-  
28 ceived information for right-of-way clearing and cost  
29 calculations based on shrub and tree cover?

30 A Let me try and clarify  
that objective for you. What it is, part of any study

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 of forest communities in or generated on density tree  
2 size, age, growth rate, etc., that information is  
3 an important fundamental part of a plant ecological  
4 study. This information is similarly useful to  
5 other people, such as our land, in our land section,  
6 and our engineering section is interested and concerned  
7 with the clearing of right-of-way. I would say that  
8 as those reports are completed and that data is calculated,  
9 are calculated and tabulated, and if required by  
10 the lands people it is passed onto them. Now in the  
11 past it has, and I have reason to believe that they  
12 made a determination of densities, tree sizes,  
13 distribution, will similarly be passed along to the  
14 land section. It is not my responsibility to do those  
15 calculations, but we have set it as an objective to  
16 provide some of that information.

17 Q Mr. Hemstock, will that  
18 information also be passed on to this Inquiry?

19 WITNESS HEMSTOCK: Yes. I  
20 think that perhaps part of the confusion - I'm not  
21 sure that I'm correct, but the specific objectives that  
22 Mr. Dabbs has listed here, as I understand it, apply  
23 to all of the programs right from 1971 on. The '75  
24 survey program dealt with the cross-delta route and  
25 the new Fort Simpson area, the new routing to Fort  
26 Simpson. So the objectives apply to that, but the  
27 specific comments here may also apply to other  
28 studies right from the start.

29 Q Yes, well Mr. Hemstock,  
30 I may be wrong but it was my understanding that the

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 1973 results had already been contained within the  
2 material which was filed before this Inquiry. The 1974  
3 one you're going to produce in a couple of months or  
4 so.

5 A Well, most of the 1974  
6 results have been filed with this last group of  
7 reports which we just passed out. The '75 results  
8 will all be published in due course and it will be a  
9 couple of months yet.

10 Q Yes, and what I am asking  
11 Mr. Dabbs, perhaps I should be asking it of you, is  
12 whether the 1975 results will contain information on  
13 each of the objectives detailed in items No. 4, 5, and  
14 6?

15 WITNESS DABBS: The informa-  
16 tion which is used for calculating an estimate of the  
17 clearing is just the type of information that I descri-  
18 bed, and yes, definitely that information on tree  
19 size, rate of growth, <sup>density,</sup> etc. as it has been  
20 collected will constitute the data contained in the  
21 report which will be published as completed, and I'm  
22 sure will be filed with this Inquiry.

23  
24  
25  
26  
27  
28  
29  
30

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 Q The same thing will  
2 apply with respect to the growth characteristics of  
3 plant communities in the cross-delta route and the  
4 Fort Simpson area.

5 A As that data is available,  
6 and every particular study we undertake throughout such  
7 a broad expanse of country you are not always offered  
8 opportunities to gather data specific to each <sup>and every</sup> objective  
9 here, but as the conditions -- the situation within  
10 each of those surveys presented the opportunity to  
11 make those studies, they will have been made and those  
12 data will be contained within a report.

13 No. 6 is not always an objec-  
14 tive that can be achieved through a survey such as the  
15 Fort Simpson survey. We may not produce a classification  
16 that's of much value to Dr. Gunn. For instance in that  
17 particular case, other surveys, definitely that has  
18 been the case.

19 Q Yes sir, and to get  
20 back where I began before Mr Marshall ceased to  
21 understand, everything, all of the results you  
22 obtained through that 1975 survey program will be in  
23 the compendium report or whatever it is that is brought  
24 to this Inquiry in a couple of months' time when it's  
25 ready. Is that correct, Mr. Hemstock?

26 WITNESS HEMSTOCK: Yes.

27 Q Turn to page 11 of your  
28 prepared evidence, please. Now, sir, here you're  
29 talking of revegetation studies, and I direct your  
30 attention to the beginning of the third full paragraph.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 "The research conducted at the test facility at  
2 Prudhoe Bay, Sans Sault, Norman Wells, plus  
3 numerous additional test areas in the Inuvik,  
4 Tuktoyaktuk and delta regions, have led us to  
5 conclude that revegetation on the pipeline and  
6 associated facilities is feasible."

7 With respect to each of Prudhoe Bay, Sans Sault and  
8 Norman Wells, can you tell me when the re-vegetation  
9 tests began?

10 MR. DABBS:

11 A The Prudhoe Bay test-site  
12 -- I believe in all three cases they started in the  
13 spring of 1971.

14 Q And in all three cases  
15 can you tell me what kind of tests they were?

16 A I can give you a rundown  
17 of general tests. If you want to go into specifics  
18 we'd have to start consulting each individual report.

19 Q Well, let's just have  
20 the general to start with.

21 A The initial objectives  
22 from the outset were one of species trials. Dr. Bliss  
23 briefly discussed this in his earlier testimony  
24 to this Inquiry. As at the outside of this revegetation  
25 research there simply was no information on the perfor-  
26 mance of the available varieties of grasses or  
27 legumes with regards to their potential for revegetation  
28 in northern<sup>areas</sup>/so the initial objective was simply one  
29 of species trials.

30 Q Meaning by that that at

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-exam by Bibbs

1 each site you tried various species to see which one  
2 would grow.

3 A That's quite correct.

4 Q And over what time span  
5 did you observe the ability of each of the species to  
6 survive?

7 A Since the inception of  
8 the program in 1971, the Prudhoe Bay and Sans Sault  
9 test-sites, the monitoring has continued in each of  
10 those plots, the Norman Wells test-site I have annually  
11 examined but have not taken the time to quantitatively  
12 sample.

13 Q And are you satisfied,  
14 Mr. Dabbs, that the results you obtained at Prudhoe  
15 Bay, Sans Sault and Norman Wells, are sufficiently  
16 representative that through each or a combination of  
17 them you can apply those results to the entire length  
18 of your pipeline?

19 A I think, sir, I go on  
20 in my testimony as you read it to include plots in  
21 Inuvik, Tuk and delta regions, which have, as I  
22 described in an earlier panel, I greatly expanded the  
23 range of the work, the diversity of terrain, and  
24 climatic conditions, under which we have tested these  
25 various varieties and mixes and on the basis of this  
26 I will conclude yes, that it is feasible.

27 Q But your Inuvik, Tuktoyak-  
28 tuk and delta tests are much more recent in time, are  
29 they not?

30 A The Inuvik tests, some of

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 which I referred to, were started, sir, in 1970 by  
2 Dr. Younkin under the direction of Dr. Bliss while dean  
3 at the University of Alberta.

4 Q And the other two,  
5 Tuktoyaktuk and delta?

6 A The Tuk sites also were  
7 started by Younkin. The delta sites have been added  
8 in the past three years.

9 Q And you're now satisfied  
10 that you have a representative set of test results  
11 that apply for the whole length of the pipeline.

12 A I believe that we can  
13 state with all confidence that it is feasible and that  
14 we have outlined as appendices to testimony the  
15 continuing studies that will go on to establish what  
16 are the variations that will be required to be applied  
17 to our plans for revegetation in order to establish  
18 final specifications.

19 Q All right, would you  
20 turn now to page 13 of your prepared evidence?  
21 Particularly the third full paragraph where you speak  
22 of a number of species proposed, for inclusion in the  
23 reseeding program being technically imported from  
24 Europe, introduced into North America some 50 to 200  
25 years ago. Now, Mr. Dabbs, since the import from  
26 Europe there has been a good deal of both natural and  
27 man-inspired selection of those species so that  
28 they will be the best growth for the particular  
29 area in which they are being grown. Isn't that correct?

30 A Yes, that's a fair  
statement.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 Q And that's so that the  
2 best -- so that man could produce something most  
3 suited to its area and most suited to the use which  
4 was going to be made of it.

5 A I'm not sure that I  
6 understand your entire question, but I think your  
7 latter point that the selection has been for specific  
8 uses is fair enough, yes.

9 Q And the fact that a  
10 species imported from Europe which successfully grows  
11 a **forage** crop in Southern Alberta, it doesn't follow  
12 how that is going to behave in northern regions.  
13 Does it?

14 A It doesn't exclude it  
15 either.

16 Q But one cannot say that  
17 because a type of grass grows a good hay crop in  
18 -- at Calgary, it is going to grow well on a pipeline  
19 right-of-way near Inuvik.

20 A That's exactly what I  
21 outlined for you when you asked me the objectives of  
22 the programs, revegetation programs in 1971. You're  
23 quite right, at that point in time we did not know  
24 the performance, what the performance of those would  
25 be under those conditions.

26 Q So that Mr. Dabbs, what  
27 significance is it that they belong to the same genera  
28 which are a natural part of the northern ecosystem?  
29 That doesn't help at all if you're going to bring in  
30 something which will not survive in a northern region.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1  
2 A Well, I'm not certain  
3 that I understand your question, sir.

4 MR. MARSHALL: It's related to  
5 the all belonging to genera, which are a natural part  
6 of ecosystems. The editorial comment is not part of  
7 your question, is that the answer?

8 MR. GIBBS: Q Mr. Dabbs, you  
9 say on page 13:

10 "Although a number of species proposed for  
11 inclusion in the reseedling program are technically  
12 imports from Europe, all were introduced into  
13 North American 50 to 200 years ago and all belong  
14 to genera, which are a natural part of the northern  
15 ecosystem."

16 I understood you to want us to conclude that as they  
17 were of the same genera, that meant that they would  
18 propogate in the north as well as they do in the  
19 south. Was that not your intention?

20 A No sir, the intent of  
21 the statement was to point out that in fact they are  
22 closely related to genera that naturally exist, just  
23 as the statement reads.

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 Q It is an interesting point  
3 but it isn't necessarily going to apply that it leads  
4 to a conclusion that they therefore will grow in the  
5 northern areas?

6 A No, it is to state the fact  
7 that anything here used is related genetically to  
8 plant material that exists in the north. Nothing more  
9 than that.

10 Q Now, sir do you see, and  
11 I am sure your going to say no, but let's put the  
12 question to you anyway; any danger that bringing in  
13 these species will lead to these species taking over  
14 some of the native grasses and replacing them, spreading,  
15 invading?

16 A I think I followed your  
17 question but it wasn't clear just what you were asking  
18 me and I am trying to cooperate.

19 Q You said you followed the  
20 question?

21 A Well--

22 Q Is there a danger of these  
23 species that it is planned to introduce, displacing  
24 species that are already there?

25 A That was my understanding.  
26 And I would say that on the basis of the argument I  
27 have made, I would say the danger is minimal or non-  
28 existent.

29 Q In your experience, Mr.  
30 Dabbs, can you relate any instance of this having

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 happened? An introduced species having invaded and  
3 taken over from a native species in the settled areas  
4 of western Canada?

5 A No, I can't, I am afraid  
6 myself, come up with an example where it has ever  
7 happened.

8 Q Well, isn't that what has  
9 happened in many of the areas with the type of grass  
10 called quack grass?

11 A Quack grass is successful  
12 only in disturbed sites, sir. In agricultural fields,  
13 roadsides, in your own lawn; that is technically a  
14 disturbance in closed natural community.

15 Q And you have never seen  
16 quack grass take over from native cover, only where  
17 it has been disturbed?

18 A I have never seen it  
19 dominate, no.

20 Q Have you seen it plant in  
21 a native cover?

22 A I could say, that I could  
23 believe that it can exist in a native community but--

24 Q And once it establishes  
25 itself, it just expands and expands and expands, doesn't  
26 it Mr. Dabbs?

27 A Not in a closed community,  
28 not in a closed natural community it doesn't sir. It  
29 does if there is some other disturbance, whatever the  
30 type of disturbance. That is the reason it has been  
successful as it is as a weed because the competition of

Banfield, Dabbs, Gunn, Hemstock,  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 a closed community has been in some way reduced and it  
3 is successful and at that point it expands, yes.

4 Q And don't you foresee this  
5 happening with some of your species which you are going  
6 to bring in from the south which don't normally grow  
7 here, them taking over in exactly that circumstance  
8 where there has been some natural disturbance of the  
9 native system?

10 A They could exist as they  
11 currently do and as they have for several decades along  
12 disturbed sites, roads, around towns, around airstrips.  
13 Yes, they could continue to exist in continued distur-  
14 bed sites.

15 Q Now sir later in that  
16 paragraph you say, after having spoken of Kentucky  
17 bluegrass and meadow foxtail and <sup>timothy,</sup> you say, "Most are  
18 circumboreal or circumpolar in distribution but  
19 restricted to disturbed habitats. Red top is never  
20 found in Arctic regions but is common in western Canada  
21 and has had sufficient time to migrate into Arctic  
22 areas if the environment had been suitable". What part  
23 of the environment Mr. Dabbs, do you believe to be un-  
24 suitable to red top migration?

25 A I refer ; here, sir, to  
26 the general Arctic and sub-Arctic environment as a  
27 whole.

28 Q Well, do you intend to say  
29 that it is too cold for red top?

30 A In the very northern areas,

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1

2

the tundra areas, yes sir, it probably is.

3

4

Q And you intend in the more  
southern areas to say it is too wet for red top?

5

A No, I don't.

6

Q And why--

7

8

A The point I make here sir

9

is that the drainage systems, the Athabaska, the  
Saskatchewan; all of their river systems are drained

10

eventually into the Mackenzie, have been draining

11

through agricultural lands in west and northwestern

12

Alberta since agricultural activity started. There has

13

been all of the opportunities nature offers to a plant

14

species, to migrate. Particularly that of flowing

15

ivers and streams in the Mackenzie River system

16

itself.

17

This species and a variety of

18

red top has been used in Alberta for a long time and

19

has not migrated north, it has not displaced any native

20

plant material, plant species from any closed plant

21

community. That's all I said.

22

Q Well, the central part of

23

your thesis Mr. Dabbs, is that none of these domestic

24

varieties are going to take root and displace native

25

varieties unless it is in a disturbed area. Is that

26

correct?

27

A That is the only area in

28

which they will be successful.

29

Q Yes. But hasn't creeping

30

red fescue and slender wheat grass had to come into

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1  
2 these native areas from somewhere other than where they  
3 are now found?

4 A The two that you mentioned  
5 sir, festuca rubra, agropyron trachycaulum  
6 exist as a natural component of boreal ecosystems and  
7 Arctic ecosystems. They have evolved a place in North  
8 America.

9 Q And has the same applied  
10 to Kentucky bluegrass, meadow foxtail and timothy ?

11 A The genus of each of those  
12 does exist in northern systems. The particular variety  
13 that may be used in itself has not been selected.

14 Q Well, what I don't under-  
15 stand Mr. Dabbs is why you can say that varieties now  
16 used in domestic use in Alberta, for example, are not  
17 going to take root or grow in the North, except in  
18 disturbed areas, when there appear now to be native  
19 grasses which must have come from elsewhere and through  
20 a process of selection, and took root and grew and are  
21 now native grasses. Why can't that happen again?

22 THE COMMISSIONER:

23 Well : is your point that  
24 if it were going to happen it would have happened by  
25 now. They have had every opportunity that dispersal  
26 over the whole continent occurs fairly swiftly and it  
27 has-- They don't appear up here yet so you are safe  
28 in predicting that if you introduce them here, and  
29 they survive it will only be in disturbed areas. Is  
30 that what your getting at here?

A Yes, sir I believe that's

Banfield, Dabbs, Gunn, Hemstock  
Jakimchuk, McCart.  
Cross-Exam by Gibbs.

1

2

a very good summary of conditions.

3

THE COMMISSIONER: Well, let's

4

stop for coffee. You can carry on afterwards.

5

(PROCEEDINGS ADJOURNED FOR A FEW MINUTES)

6

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

7

Cross-Exam by Gibbs

MR. GIBBS: Sorry, I thought  
we were proceeding with the film.

THE COMMISSIONER: I think we  
will carry on if you don't mind, if you are in a  
position and then we will see the film and then we  
will be a little farther along.

MR. MARSHALL: We'll tell you  
when we have the popcorn ready, Mr. Gibbs.

MR. GIBBS: I wonder who is  
sponsoring this film or whether it is going to be marked  
as an exhibit.

MR. CARTER: Cut the corn.

THE CHAIRMAN: Come on. Let's  
get on with it.

MR. GIBBS: Mr. Dabbs, will  
you turn to page 15 of your prepared evidence please?  
Do you have it?

WITNESS DABBS: A Yes, sir.

Q By way of preliminary,  
can you tell me how deep the snow was on the snow road  
test in 1973-'74?

A On the road itself?

Q Yes.

A We would have to consult  
the snow road report which gives a very accurate  
measurement throughout because the depth of snow was  
slightly different in different locations. For instance,  
as Mr. Williams has explained to the Inquiry on the  
grades on the hills, there was a considerably more snow

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

1 applied there than on a straight and level. The --  
2 generally, however, and I think that's all you are  
3 asking there were the snow pavement itself, the  
4 processed snow pavement was approximately six inches  
5 thick. It's my recollection and there was another  
6 six or eight inches of compacted but not processed  
7 snow between the pavement and the tops of any tussocks  
8 or mounds.  
9

10 So there is no  
11 one answer to your question because the depth of the  
12 snow between mounds could have been a couple feet and  
13 it could have been just a foot over the tops of mounds.

14 Q Well, it would vary  
15 between one and two feet in thickness?

16 A As a general statement  
17 without checking the report, I will accept that.

18 Q You speak in Item 1 with  
19 a large decrease in percent of ground cover due to  
20 construction and use of the snow road. That decrease  
21 in ground cover -- was the ground cover killed  
22 or did it grow again after one season?

23 A Oh, it was not killed.  
24 By ground cover that may be a slightly misleading to  
25 people who are not familiar with quadra-sampling of  
26 vegetation but it's the ground covered by leaves.  
27 Those were in many cases knocked off or broken off and  
28 the plants that were not killed and those  
29 shrubs and have recovered.

30 Q And so, your conclusion

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

1  
2 is that there is no permanent damage then because of  
3 that snow road.

4 A I'm just trying to see  
5 exactly whether I used those words or not but there is  
6 permanent effects in as much as the trees were removed  
7 but there is no damage in my opinion.

8 Q No, you say there is no  
9 significant change in surface elevation, organic layer  
10 thickness, or active layer thickness, so . except  
11 that the trees are broken there is no lasting  
12 damage to the soil or the subsoil?

13 A That's been our measure-  
14 ment.

15 Q Would you suggest, Mr.  
16 Dabbs, that that test would be representative of what  
17 will occur with snow roads throughout the length of  
18 the pipeline?

19 A I think the best I can  
20 answer that, sir, is if, as I have worded it here the  
21 snow roads are built in a similar inasmuch as they  
22 are have been completely protective of ground cover,  
23 both living and dead, then I will make the conclusions  
24 that I have, whether or not it's applicable to the rest  
25 of the route and it would have to be a question posed  
26 to someone such as Mr. Williams.

27 Any descriptions that  
28 we have been given, the same type of processed snow  
29 road will be used throughout the route in that I would  
30 then come to these conclusions.

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

Q Then the conclusion is restricted to this that if you build a snow road in the same manner, in the same area, you will get the same results?

A My conclusion is that if you build a snow road in the same manner then the results will be the same, not necessarily restricted to the same area.

Q I see. Regardless of where in the length of the pipeline --

A As long as it is built in the same manner.

Q Could you turn now to page 17 of your prepared evidence, please? Where you talk about methanol spills and in Item 1, you refer to 65% damaging effect on vegetation or reduction in plant cover. Again, was that reduction in plant cover due to the plant being killed?

A That measurement was a loss of cover -- ground cover -- of living materials and as the report indicated there is and has been a recovery of that.

Q The full 65% has re-covered again?

A Not the full 65, no, it is slower to recover particularly at this heavier concentration.

Q Well, how much of -- what percentage is permanent damage then from that sample

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

methanol spill?

A I think that we can conclude permanent damage even yet. I think data that will be presented in a forthcoming report will demonstrate the amount of recovery and that in itself couldn't be concluded as permanent so I'm afraid I couldn't answer -- give you a good answer.

Q Of the reduction of plant cover of up to 65%, how much of that was moss and lichen?

A I would have to consult the report closely to give you an answer. I'm sorry.

Q Did you examine it that carefully to determine whether any moss or lichen was killed by the methanol spill?

A Oh yes.

Q You did.

A Yes.

Q And you say the research is continuing <sup>and</sup> further results will be presented when available. When do you expect those further results?

A In this case, I am referring to plans for even continued studies this winter so I'm afraid in this case, I couldn't give you an accurate estimate of time when the report would be available.

Q What is the continuing research? Are you going to cause more methanol spills in different areas or are you going to monitor the ones that occurred or that you induced in 1975?

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

1

2

A I think both.

3

Q I see and what do you

4

anticipate you will learn from more methanol spill?

5

A The response or effect

6

of methanol on different types of plants, the test I

7

refer to here was in a open black spruce lichen

8

forest area and we want to expand that to other types

9

of -- at least, one or two other types of plant

10

communities.

11

Q And have you chosen the

12

sites where that will be done?

13

A I believe they have. I

14

haven't selected them myself but I believe the site

15

has been selected.

16

Q And the time when it

17

will be done?

18

A It would be in late winter.

19

The specific time isn't that critical.

20

Q Are the tests, sir, of

21

general application to the extent that one could say

22

that when you have completed this winter's tests, you

23

will have results which will apply throughout the

24

length of the pipeline?

25

A I wouldn't think that

26

it would be applicable necessarily to all vegetation

27

types.

28

Q To all vegetation types,

29

did you say?

30

A Throughout the length

Hemstock, Dabbs, McCart, Gunn,  
Jakimchuk, Banfield  
Cross-Exam by Gibbs

of the pipeline.

Q Are you selecting certain  
ones to apply the test to or is it by random, at  
random that some will not be subject to tests?

A Well, we're interested  
in the effects on representative areas or areas that  
are representative of major plant community types at  
this point in time in the northern areas.

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 Q But when the results of  
2 those tests are available they will be brought to  
3 this Inquiry?

4 WITNESS HEMSTOCK: Yes sir,  
5 but as he pointed out, some of the work would not  
6 commence until next August.

7 Q I'm sorry, I didn't hear.

8 A He pointed out that some  
9 of the work would not commence until next March or  
10 April, so it would be possibly a year hence before  
11 the results would be available.

12 Q I may not be here a year  
13 hence. Would you look at the second last paragraph on  
14 page 17, Mr. Dabbs? I take it from that that after  
15 telling us about how the domestic varieties of grass  
16 will grow on the disturbed areas, nonetheless you're  
17 proposing to cultivate and harvest and seed some  
18 indigenous varieties of grass cover.

19 WITNESS DABBS: Well, your  
20 statement is fair enough but it doesn't apply to that  
21 particular paragraph.

22 Q Well, I understand the  
23 paragraph to read:

24 "Many of the varieties found to grow successfully  
25 in Northern areas are not grown commercially in  
26 large quantities. Consequently Arctic Gas engaged  
27 the services of a seed broker to assist us in  
28 writing seed multiplication contracts with  
29 certified growers."

30 Doesn't that tell me that you're going to try and

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 produce enough seed of native varieties to seed the  
2 pipeline?

3 A Well, let's look at the  
4 first sentence where I say,

5 "are not grown commercially in large quantities."  
6 They are grown commercially in smaller quantities and  
7 these are the varieties, some of the varieties that  
8 have been listed in the specifications which were  
9 attached as appendix to my panel 2.

10 Q Well, Mr. Dabbs, I'm  
11 not trying to fence with you. Let me put it this way,  
12 do you intend to seed some native varieties on the  
13 pipeline right-of-way, is that right?

14 A Oh yes, sir. That's not  
15 what we're talking about in this paragraph.

16 Q That's what you're  
17 talking about in that paragraph, is it?

18 A That's not what I'm  
19 talking about in this paragraph, sir.

20 MR. MARSHALL: I think they've  
21 got two programs.

22 A Yes.

23 MR MARSHALL: That's what he  
24 gets to. This one he's talking about commercial seeds,  
25 and they've got some contracts to get enough quantities.  
26 They have another program where they are harvesting  
27 native species and they have that under another program,  
28 Mr. Gibbs; but your overall point is right that yes,  
29 they are trying to gather these.

30 MR. GIBBS: Well, we are at

Banfield, Dabbs, Gunn  
Hemstock, McCart, Jakimchuk  
Cross-Exam by Gibbs

1 one on this, that you are attempting to get together  
2 sufficient seed of the native varieties to seed the  
3 right-of-way. Is that right?

4 WITNESS DABBS: That statement  
5 is correct with some qualification, in that the native  
6 seed we do hope to use is part of the seeding of the  
7 right-of-way, yes.

8 Q And the reason for that  
9 is that you don't expect to have enough native seed  
10 to reseed the right-of-way, is that right?

11 A We have no evidence to  
12 show that we will have, so were taking a conservative  
13 approach.

14 Q And if you do have,  
15 you will, I take it, use the native seed rather than  
16 introducing varieties from -- southern domestic  
17 varieties.

18 A Well, sir, the evidence  
19 of everyone associated with this research to date would  
20 indicate that there is a strong need, an important  
21 need for the inclusion of the agronomic varieties as  
22 specified.

23 Q You would propose to  
24 introduce those even though you had sufficient native  
25 grass seed?

26 A We are creating a hypo-  
27 thetical scenario here; the evidence to date, and  
28 I make my statements specifically on the basis that  
29 the data at hand would show that there is a need for  
30 the inclusion of the rapid-establishing agronomic

1 varieties for purposes of erosion control. That is a  
2 fact everyone has before them at the moment. If that  
3 fact changes, we would certainly go along with your  
4 suggestion.

5 Q Well then, how do you  
6 propose to use the native grasses then if you're going  
7 to put in the domestic varieties?

8 A As mix, either as a mix  
9 or as a supplement seeding, as a dressing to areas.

10 Q Do you expect then, as  
11 Dr. Vaartnou does, that the introduced grasses from the  
12 southern areas are going to winter-kill either by frost  
13 or by disease?

14 A In time they do when they  
15 trundle in the vigour and they're replaced.

16 Q So that introduction is  
17 purely a temporary expediency?

18 A For the reasons and the  
19 objectives set, yes sir.

20 Q Because you want quickly  
21 to get a cover to prevent erosion.

22 A Yes sir.

23 Q And you don't think that  
24 that can be accomplished by seeding native varieties?

25 A There's no evidence to  
26 conclude that.

27 Q Will you now turn to  
28 page 18, please? The first full paragraph you talk  
29 about the release of two unlicensed varieties. Would  
30 you explain to me the difference between a licensed

1 and unlicensed variety?

2 A A licensed variety is  
3 one that which has undergone the many years of testing,  
4 selection, and has conformed to all the requirements  
5 set under regulations to the Canada Seed Act. It's  
6 a licensing process laid down by the Department of  
7 Agriculture. This is a process that takes many years.  
8 There are innumerable unlicensed varieties under test  
9 that's the objective of many people in the Department  
10 of Agriculture in plantbreeding programs, a long process  
11 of testing, in some cases results in the culmination  
12 of a licensing of a variety for commercial production  
13 and sale in Canada. An unlicensed variety is one that  
14 has not undergone that same testing.

15 Q Does it imply that by the  
16 time it has become a licensed variety that there are  
17 large quantities available?

18 A Oh no.

19 Q And do you propose to use  
20 some of those two licensed varieties for revegetation?

21 A Sorry, in your question  
22 you said "those two licensed varieties".

23 Q Well, the two you  
24 referred to.

25 A Unlicensed varieties.

26 Q Well, when you say "the  
27 release of these varieties" you're not implying that  
28 they will now become licensed?

29 A No, they have not become  
30 licensed for the purposes I've described, and yes, we

1 propose to use them as they have now been released for  
2 this application by the Department.

3 Q They have been released  
4 although they are not licenced?

5 A Yes, the licencing is  
6 quite a-- for different purposes, sir.

7 Q I see, and you propose  
8 to use some of those in your revegetation program.

9 A Yes.

10 MR. GIBBS: That's all, thank  
11 you, sir.

12 MR. MARSHALL: It's now a quar-  
13 ter past four, sir, and I wonder if we might have the  
14 film to conclude our day?

15 THE COMMISSIONER: All right.

16 MR. MARSHALL: Fine, Dr. Gunn?

17 WITNESS GUNN: Mr. Commissioner,  
18 this film was prepared about two years ago and it  
19 describes the biological research that was carried on  
20 for Arctic Gas by the consultants. It is a public  
21 relations film so there are a few pro-pipeline state-  
22 ments in it which you can recognize and disregard, but  
23 basically it's very low key, it doesn't stress that  
24 as many public relations films do, and I think it  
25 does provide a very good overview of the experimental  
26 work, particularly the disturbance tests.

27 I suggest, sir, that you'd  
28 better come and sit back here so you can see.
